Abercrombie, David 1–5

Academies of the Arabic Language and the Standardization of Arabic 5–8

Accent Reduction 8–11

Acculturation in World Englishes 12–15

Acquisition Planning 15–23

Adverbs 24–28

Advocacy in Language Teaching 29–31

Affect and Language Teaching 32–36

African Union 36–43

Agar, Michael 43–46

Age-Appropriate Instruction and Assessment for School-Age Learners 46–49

Agency in Second Language Acquisition 49–56

Alderson, J. Charles 56–59

Allwright, Dick 59–63

Analysis of Dialogue 64–69

Analysis of Discourse and Interaction: Overview 70–73

Analysis of Gender in Interaction 74–79

Analysis of Identity in Interaction 79–86

Analysis of Mediated Interaction 86–91

Analysis of Narrative in Interaction 91–97

Analysis of Silence in Interaction 98–104

Analyzing Spoken Corpora 104–112

Anthropological Linguistics 113–118

Anticipatory Discourse 118–124

Approaches to Second Language Vocabulary Teaching 124–129

Aptitude in Second Language Acquisition 129–133

Arabic Standardization 134–136

Assessing Multilingualism at School 136–141

Assessment of Academic Language for Specific Purposes 141–147

Assessment Across Languages 147–155

Assessment of Business and Professional Language for Specific Purposes 155–161

Assessment in the Classroom 161–169

Assessment of Cultural Knowledge 169–176

Assessment and Evaluation: Mixed Methods 176–185

Assessment and Evaluation: Quantitative Methods 185–194

Assessment of Grammar 195–204

Assessment of Integrated Skills 205–212

Assessment of Listening 212–218

Assessment of Pragmatics 218–226

Assessment of Reading 226–233

Assessment of Speaking 234–240

Assessment and Testing: Overview 241–244

Assessment of Translation 245–251

Assessment of Vocabulary 251–257

Assessment of Writing 257–264

Assessment of Young English-Language Learners 264–269

Attention, Noticing, and Awareness in Second Language Acquisition 269–275

Attitudes and Motivation in Bilingual Education 276–281

Attrition and Multilingualism 281–290

Audiovisual Translation 290–295

Austin, John L. 295–299

Authenticity in the Language Teaching Curriculum 299–302

Authoring Tools for Language Assessment 302–309

Automated Essay Evaluation and Scoring 309–315

Automatic Speech Recognition 316–323

Automatization, Skill Acquisition, and Practice in Second Language Acquisition 323–331

Aviation English 331–336

Bachman, Lyle F. 337–340

Baetens Beardsmore, Hugo 341–344

Baker, Colin 344–347

Bakhtin, Mikhail M. 347–349

Bakhtin and Second Language Acquisition 350–355

Bamberg, Michael 356–358

Bangla Academy 359–360

Bardovi-Harlig, Kathleen 361–363

Basic English 364–367

Bateman, John 368–370

Bazerman, Charles 370–374

Belcher, Diane 374–378

Beliefs in Second Language Acquisition: Learner 378–384

Beliefs in Second Language Acquisition: Teacher 385–390

Bell, Allan 391–394

Berk-Seligson, Susan 395–397

Bhatia, Vijay 397–401

Bialystok, Ellen 402–405

Bias in Language Assessment 406–412

Biber, Douglas 412–416

Bible Translation 417–424

Bilingual Education 425–429

Bilingual Education and Immigration 429–438

Bilingual/Immersion Teacher Education 438–443

Bilingualism and Age 443–447

Bilingualism and Bilinguality 447–454

Bilingualism and Cognition 454–462

Bilingualism and Multilingualism: Quantitative Methods 462–472

Bilingualism and Speech Perception 472–480

Bilingualism and Youth Language 480–487

Bilingual Lexicography 487–493

Bilingual Literacy 493–502

Bilingual and Monolingual Language Modes 502–510

Bilingual and Multilingual Education: Overview 510–517

Blum-Kulka, Shoshana 518–520

Bowen, J. Donald 520–523

Brain Activity During Second Language Processing (ERP) 523–530

Brain Imaging Studies and Vocabulary 530–538

Brazil, David 538–539

Bredella, Lothar 540–541

Broeders, A. P. A. 541–543

Brown, Penelope 543–547

Bush, Vannevar and Hypertext 547–553

Butters, Ronald R. 553–556

Byram, Michael 556–558

Byrnes, Heidi 558–562

Canada's Office of the Commissioner of Official Languages 563–565

Canagarajah, A. Suresh 565–568

Candlin, Christopher N. 568–570

Carroll, John B. 570–573

Case Study 573–581

Catford, J. C. 581–583

Cenoz, Jasone 585–588

Central Institute of Indian Languages 588–590

Chaos/Complexity Theory for Second Language Acquisition 590–597

Chapelle, Carol A. 597–602

Child Pragmatic Development 602–609

Christian, Donna 609–611

Citizenship Education 611–615

Clark, John L. D. 616–619

Classroom Discourse 620–626

Classroom Research 626–629

Classroom Research on Pragmatics 629–634

Classroom Research in Second Language Acquisition 635–641

Cluster Analysis 641–647

Clyne, Michael 647–650

COBUILD Project 650–653

Code Mixing 653–657

Code Switching 657–664

Cognates 664–670

Cognitive Approaches to Communication Strategies 671–675

Cognitive Approaches to Translation 675–684

Cognitive Constructivism 684–689

Cognitive Grammar 690–697

Cognitive Linguistics of Second Language Acquisition 698–705

Cognitive Models of Interaction 706–711

Cognitive Second Language Acquisition: Overview 711–714

Cognitive Second Language Acquisition: Quantitative Methods 715–723

Cohen, Andrew D. 723–725

Collaborative Language Learning 725–730

Colonialism and Language Policy and Planning 730–735

Commercial Translation 735–739

Common European Framework of Reference 740–746

Community Interpreting 746–753

Comparative Phonetics and Phonology 753–760

Comparing Groups With Multiple Dependent Variables 760–767

Comparing Groups With Multiple Independent Variables 767–775

Comparing Two Independent Groups 775–779

Comparing Two Related Samples 779–786

Comparing Two+ Independent Groups 787–792

Comparing Two+ Related Samples 792–797

Competition Model 798–802

Complexity in Multilingual Systems 802–807

Compound Words 807–810

Computer-Assisted Language Learning Effectiveness Research 810–815

Computer-Assisted Language Learning and Machine Translation 815–823

Computer-Assisted Pronunciation Teaching 823–834

Computer-Assisted Qualitative Data Analysis Software (CAQDAS) 834–839

Computer-Assisted Translation 839–843

Computer-Assisted Vocabulary Load Analysis 844–853

Computer-Mediated Communication and Second Language Development 853–857

Computer Scoring of Spoken Responses 857–863

Conceptualizing and Researching “New Literacies” 863–870

Concordancing 871–879

Conference Interpreting 880–884

Connectionism 884–890

Connectives 891–897

Content-Based Instruction in English for Specific Purposes 897–906

Content-Based Language Instruction 906–911

Content and Language Integrated Learning 911–920

Context in the Analysis of Discourse and Interaction 920–926

Conventional Methods for Assessing Vocabulary 927–931

Conversational Grammar 931–938

Conversational Implicature 938–943

Conversation Analysis and Affiliation and Alignment 944–948

Conversation Analysis and Child Language Acquisition 949–954

Conversation Analysis and Classroom Interaction 954–958

Conversation Analysis and Cockpit Communication 958–962

Conversation Analysis and Communication Disorders 962–967

Conversation Analysis and Design 967–971

Conversation Analysis and Dyads, Triads, and More 972–976

Conversation Analysis and Education 977–982

Conversation Analysis and Emergency Calls 982–985

Conversation Analysis and Emotion and Cognition in Interaction 985–991

Conversation Analysis and Ethnomethodology 991–996

Conversation Analysis and Gender and Sexuality 996–1000

Conversation Analysis and Identity in Interaction 1000–1004

Conversation Analysis and Institutional Interaction 1005–1011

Conversation Analysis and Interactional Linguistics 1012–1016

Conversation Analysis and Interaction in Standardized Survey Interviews 1016–1022

Conversation Analysis and Interview Studies 1022–1027

Conversation Analysis and Language Acquisition 1027–1032

Conversation Analysis and Laughter 1033–1038

Conversation Analysis and Learning in Interaction 1038–1043

Conversation Analysis and Lingua Franca 1043–1047

Conversation Analysis and Meetings 1048–1050

Conversation Analysis and Membership Categories 1050–1055

Conversation Analysis Methodology in Second Language Studies 1055–1061

Conversation Analysis and Multimodality 1061–1068

Conversation Analysis and Other-Initiated Repair 1068–1075

Conversation Analysis: Overview 1075–1082

Conversation Analysis and Prosody 1082–1086

Conversation Analysis and Recipient Behavior 1086–1094

Conversation Analysis and Repair Organization: Overview 1094–1097

Conversation Analysis and Second Language Acquisition: CA-SLA 1097–1104

Conversation Analysis and Self-Repair 1105–1110

Conversation Analysis and Therapy 1111–1114

Conversation Analysis and Transcription and Data 1114–1121

Conversation Analysis and Turn Taking 1121–1127

Cook, Vivian 1127–1131

Core Vocabulary 1132–1136

Corpora: Chinese-Language 1136–1142

Corpora: English-Language 1143–1151

Corpora: French-Language 1152–1158

Corpora: German-Language 1159–1168

Corpora in Language for Specific Purposes Research 1168–1174

Corpora in the Language-Teaching Classroom 1175–1181

Corpora and Literature 1182–1187

Corpora: Multimodal 1188–1190

Corpora: Specialized 1191–1200

Corpora in the Teaching of Language for Specific Purposes 1201–1207

Corpus Analysis of Business English 1207–1214

Corpus Analysis of Child Language 1214–1222

Corpus Analysis in Dialectology 1222–1229

Corpus Analysis of English as a Lingua Franca 1229–1234

Corpus Analysis of English as a World Language 1234–1242

Corpus Analysis of European Union Documents 1242–1247

Corpus Analysis in Forensic Linguistics 1249–1256

Corpus Analysis of Historical Documents 1256–1260

Corpus Analysis of Key Words 1260–1267

Corpus Analysis of Language in the Workplace 1267–1275

Corpus Analysis for a Lexical Syllabus 1275–1282

Corpus Analysis of Literary Texts 1282–1289

Corpus Analysis for Operational Communication 1289–1299

Corpus Analysis of Political Language 1299–1307

Corpus Analysis of Scientific and Medical Writing Across Time 1307–1312

Corpus Analysis of Sign Languages 1312–1319

Corpus Analysis in Social and Public Policy Research 1319–1326

Corpus Analysis of Spoken English for Academic Purposes 1326–1333

Corpus Analysis in Translation Studies 1333–1338

Corpus Analysis of the World Wide Web 1339–1347

Corpus Analysis of Written English for Academic Purposes 1347–1353

Corpus-Based Linguistic Approaches to Critical Discourse Analysis 1353–1360

Corpus-Based Testing 1360–1366

Corpus Linguistics: Historical Development 1366–1372

Corpus Linguistics in Language Teaching 1373–1376

Corpus Linguistics: Overview 1377–1379

Introduction to *The Encyclopedia of Applied Linguistics*

CAROL A. CHAPELLE

The Encyclopedia of Applied Linguistics is a reference work encompassing the range of research on language-related problems that arise in the real-world contexts where languages are learned and used. Because of the wide range of issues that applied linguists work on, a precise definition of the field is difficult to articulate. In his 2007 *Introduction to Applied Linguistics*, Davies points out that one might be tempted to conclude that “because language is everywhere, applied linguistics is the science of everything,” but such a conclusion would be neither correct nor useful (Davies, 2007, p. 2). If applied linguistics is not the science of everything, how is it defined?

Simpson, the editor of *The Routledge Handbook of Applied Linguistics*, defines applied linguistics as “the academic field which connects knowledge about language to decision-making in the real world . . . In this sense applied linguistics mediates between theory and practice” (Simpson, 2011, p. 1). In *The Oxford Handbook of Applied Linguistics*, in place of a definition, Kaplan indicates that “Applied linguistics is a difficult notion to define.” He goes on to say that the *Handbook* does not “provide a definitive definition of the field,” and then explains the historical origin of the field through the efforts of language teachers wanting to distance themselves from their colleagues teaching literature (Kaplan, 2010, p. vi). These two very recent books provide a wealth of examples of work in applied linguistics, which help to demonstrate the difficulty the editors faced in constructing a usefully precise and inclusively accurate definition of the field.

Davies and Elder, editors of *The Handbook of Applied Linguistics* published by Blackwell, present a definition in concrete terms through multiple examples of the types of problems that applied linguists work on:

Applied linguistics is often said to be concerned with solving or at least ameliorating social problems involving language. The problems applied linguistics concerns itself with are likely to be: How can we teach languages better? How can we improve the training of translators and interpreters? How can we write a valid language examination? How can we evaluate a school bilingual program? How can we determine the literacy levels of a whole population? How can we helpfully discuss the language of a text? What advice can we offer a Ministry of Education on a proposal to introduce a new medium of instruction? How can we compare the acquisition of a European and an Asian language? What advice should we give a defense lawyer on the authenticity of a police transcript of an interview with a suspect? (Davies & Elder, 2004, p. 1)

These examples of questions that applied linguists address begin to rein in the “theory of everything.” In the questions one can see applied linguistics in terms of the areas of research it can encompass. At the same time, however, such questions because of their origin in everyday social practices may not reflect the academic and scholarly dimension of applied linguistics. One can easily find instances where someone offers an improvement for foreign-language teaching, translator training, language-test development, and so forth, having no connection whatsoever to applied linguistics. The definition of applied linguistics then needs

to extend beyond the questions posed because, as Bygate pointed out, “apparently simple questions conceal matters of complexity and sensitivity, which on closer scrutiny raise more general issues, which also characterize the broader field of applied linguistics” (Bygate, 2004, p. 6). Bygate identified five main issues in the broader field including (a) evaluating the appropriateness of the granularity and perspective researchers use to specify a problem under investigation, (b) establishing trustworthiness of data interpretation, (c) creating an appropriate degree of collaboration between researcher and participants, (d) communicating research results to participants in a manner that allows for sufficient follow up, and (e) understanding the best relationship of theory and data collection and interpretation.

These issues underlie the discussion of language-related problems that readers find in the *Encyclopedia*. However, such issues stated generally can be said to underlie any social science more generally. To characterize applied linguistics, one needs to include explicitly the linguistic dimension of the field. The authors of *Mapping Applied Linguistics* accomplish this by defining applied linguistics as a mode of inquiry about language-related problems requiring consideration of “both the social and cognitive nature of language” (Hall, Smith, & Wicaksono, 2011, p. 19). Other ingredients of mode of inquiry are taking into account the needs of clients such as learners, test-score users, and businesses, being responsive to contextual factors affecting research, and engaging in collaboration in the design and evaluation of findings and recommendations (Hall, Smith, & Wicaksono, 2011, p. 19). In short, Hall, Smith, and Wicaksono see applied linguistics as a mode of inquiry engaged with real people and issues arising in a political environment where academic perspectives and research alone may or may not be important in conceptualizing problems and finding solutions. In such an environment, problem solvers must genuinely engage with local knowledge and practice in seeking solutions.

Defining the Boundaries

A reference on applied linguistics needs to contain entries explicating the domains of language problems addressed by applied linguists, detailing the nature of the complexity and sensitivity underlying the research, while portraying applied linguistics as a mode of inquiry that engages with the people and issues connected to real-world problems. Spanning the problems, it needs to cover the complexity of approaches to the study of language, language use, and language learning that applied linguists take. The search for common ground as a basis for categories and boundaries could be undertaken in a number of different ways, but for the *Encyclopedia*, two basic principles outlined by S. Pit Corder in the early 1970s provided useful guidance.

One principle addresses the boundary question. In *Introducing Applied Linguistics*, S. Pit Corder underscored the delicate analysis entailed in selecting the contents. One needs to decide between, on the one hand, the domains of inquiry that could logically be included within the study of language-related problems and, on the other, the reality of the principal topics that appear at gatherings where applied linguists meet, the areas studied by students who obtain degrees in applied linguistics, and the meaning that the term has “in common usage,” as Corder put it (1973, p. 7).

The design of the *Encyclopedia* followed the same principle, but many years hence, the outcome in terms of selection of topics is dramatically different. Corder’s introduction is focused on applied linguistics as it pertains to second and foreign-language teaching because that was the domain of language problems investigated at that time. Today, language teaching remains extremely important in the field, but applied linguistics has expanded to encompass the variety of empirical and theoretical perspectives pertaining to language teaching in addition to the many other issues and problems within the domains of

education, professions, government, politics and law, and the general workings of society. The *Encyclopedia* includes topics across these areas.

A second principle of boundary was developed by Corder in response to the need to decide how much content in an applied linguistics reference should be devoted to linguistics. Corder's position was that applied linguistics must include analytic perspectives and knowledge from linguistics. However, unlike a work in linguistics, one in applied linguistics must select "what linguistics is about, as seen through the eyes of the applied linguist" (1973, p. 7), rather than present analytic perspectives for studying language with the purely scientific goal of better understanding language. Many years later, Cook expanded on the need to see linguistics through the applied linguist's eyes:

Linguistic theory and description cannot . . . be deployed directly to solve the problems with which applied linguistics is concerned. One important reason is the nature of the problems themselves. They, too, like models of linguistics, represent certain perspectives on reality. Applied linguistics is not simply a matter of matching up findings about language with pre-existing problems but of using findings to explore how the perception of problems might be changed. It may be that when problems are reformulated from a different point of view they become more amenable to solution. This changed perception may then, in turn, have implications for linguistics. (Cook, 2003, p. 10)

Choices concerning the coverage of linguistic topics in the *Encyclopedia* were guided by this conception of the linguistics–applied linguistics interface. Within the *Encyclopedia's* boundaries readers will find entries on linguistics as selected for their relevance to applied linguistics. It includes topic areas on the study of phonetics and phonology, lexis, grammar, pragmatics, and discourse, all seen through the eyes of applied linguists. The area editors selected the topics and perspectives that have been useful for addressing real-world problems in which language plays a central role. In order to reflect the interests of applied linguists, the *Encyclopedia* includes not only areas of language study but also sections on language learning and use.

A third boundary issue presents itself today as applied linguistics embodies a mode of inquiry in addition to areas studied: What research methodologies should be included in the *Encyclopedia*? In the years since Corder's work, applied linguistics has developed language-based methodologies for the study of language that are pertinent to particular types of language problems. At the same time applied linguists draw upon and adapt research methodologies from the social sciences. Issues in research methodology appear throughout the *Encyclopedia*, but three topic areas were developed to focus specifically on research methodology.

Creating Areas

The *Encyclopedia* is composed of 27 topic areas, each of which was developed by an area editor or area editors with the appropriate expertise to identify the specific topics and perspectives relevant to applied linguists. Throughout these topic areas, the entries reflect domains of language problems and practice in the following: (a) education, including second/foreign-language education and language issues as they pertain to learning school subjects; (b) society; (c) professions; (d) government, politics, and law. Many of the examples used throughout are English because of the pervasive use of English in applied linguistics, but entries also include examples from languages other than English.

The 27 topic areas were developed within four broad categories defined to ensure appropriate coverage through assignment of an editor or editors to develop that area. The first category, that of areas of research and practice, includes areas in which real-world problems

cluster, research methodologies are shared, and results exist. Many professionals in applied linguistics would associate their particular expertise with one or more of these areas. The second category, analysis of language and communication, contains entries reflecting applied linguists' perspectives on linguistics. The third category, approaches to language use and second language acquisition, includes entries pertaining to methods of analysis arising from particular areas of applied linguistics. And fourth, the category of research methods contains entries on the empirical and analytic methodologies applied linguists adopt and adapt from other social science disciplines.

Areas of Research and Practice

This section of the *Encyclopedia* includes areas of applied linguistics that have developed around particular problems where language expertise is needed to understand and address issues. Continuing the trend set by Corder's presentation of applied linguistics many years ago, the *Encyclopedia* contains a large section on **language learning and teaching**. Entries include descriptions of the knowledge pertaining to the formal study of an additional language—one that is developed after the home language. The problem of learning non-primary languages is a challenge for people worldwide, who tackle it for a wide variety of reasons. Area editor Lourdes Ortega defined the entries in this area to include research aimed at better understanding of both learning (from the student's perspective) and teaching (from the teacher's perspective).

Whereas language learning and teaching are concerned with language study, the entries in the **bilingual and multilingual education** area cover issues concerning the use of two or more languages for instruction across subject areas. In contexts of bilingual and multilingual education, students learn through more than one language in school in order to develop their academic language competence in more than one language and to afford status and maintenance of more than one language in society. The study of **bilingualism and multilingualism** (i.e., multilingualism outside the school setting) involves another set of issues, because it is affected by different factors and can take place in a wide range of situations. The area editors Jasone Cenoz and Durk Gorter designed these areas and commissioned a revealing set of entries covering the issues.

An area of extensive study in settings where bilingual or multilingual education takes place is the development of **literacy** in school and other settings. Although the study of literacy is the concern of many researchers in education beyond applied linguistics, Eva Lam conceptualized this area of the *Encyclopedia* from the perspective of applied linguistics by including facets of the study of literacy relevant to settings of language contact. Moreover, topics include the changing face of literacy as it is affected by globalization and information and communication technology, both of which have changed literacy demands. This section therefore spans literacy in school settings and other areas of society.

The topic area of **language policy and planning** covers the theory, research, and practice of language policy making or deliberate planning. The editor, Joseph Lo Bianco, points out that, despite the long-time reality of societal multilingualism and some form of implicit language policies and planning, only relatively recently have these activities become the object of academic interest. Such interest and input are warranted in view of the consequences of language policy and planning for affected individuals, through policy implementation in education, professional settings, and government.

Another area of applied linguistics, **forensic linguistics**, has developed around the connections between language and the law. Krzysztof Kredens has commissioned a set of entries that introduce and explain two areas of forensic linguistics: the linguistic study of legal texts and processes as well as the provision of linguistic evidence in legal cases. The latter area in particular continues to grow as a result of migration and communication

technologies, both of which create situations for language contact. Legal cases are often based on efforts to obtain human rights which can include language rights.

Translation and interpreting is another area rapidly expanding because of increased language-contact situations, such as new multinational economic and political entities (e.g., the European Union), where access to high-quality communication is expected by participants who are dealing with sophisticated and important topics. These purposes for communication among people of diverse languages are supported technically by the communication infrastructure made possible by the Internet, but the achievement of actual communication is often the result of work by translators and interpreters. Claudia V. Angelelli, Nadja Grbic, and Brian Baer have gathered entries that express today's complex interface between communication needs, technologies, and translation and interpreting.

In all of the areas outlined above, professionals rely on language **assessment and testing** for a variety of purposes. This area in itself encompasses a complex set of issues, research methodologies, and practices. Carol A. Chapelle and Lia Plakans have identified the basic areas of this domain, in which the purpose is to gather systematically language-related behaviors to be used in making inferences about language ability and capacity for language use on other occasions.

Another strand that runs throughout each section of the *Encyclopedia* is how the **technology and language** connection expands, creates, and redefines the problems of concern to applied linguists. The area editor, Thomas Cobb, has assembled entries describing how technology is used in language tasks, many of which involve language teaching and learning. Although computer technology comes into play in many of the entries throughout the *Encyclopedia*, this topic area highlights the complexity of technology issues in a new generation of applied linguistics.

Like technology, **language for specific purposes** is an area of inquiry that spans the entire *Encyclopedia*, but is sufficiently integral to merit an area containing entries that develop the specific purpose–language interface itself. Thomas A. Upton and Ulla Connor have gathered entries that focus on analysis and teaching of language in a manner that meets specific language needs of non-native speakers of the language. Specific language needs cut across academic, vocational, and professional contexts.

Analysis of Language and Communication

The analysis of language and communication underlies language problems such as how to teach an additional language, how to improve translation using computer technology, or how to conduct an analysis that is useful as linguistic evidence in a legal case. The *Encyclopedia* therefore includes sections covering issues of analysis in each of the areas of language relevant to applied linguistics. The concerns in applied linguistics require certain perspectives on language and therefore the entries in this category have defined language and selected perspectives on analysis “as seen through the eyes of the applied linguist,” as Corder put it.

In view of applied linguists' concern with language in use, at the broadest level of analysis, language is studied in relation to the **culture and context** in which it is used. Area editor Karen Risager has included entries in this section that reflect the cross-disciplinary influence on the study of culture and context in applied linguistics. Disciplinary perspectives include anthropological linguistics, cultural linguistics, postcolonial studies, and cultural studies, which are used to shed light on concepts such as ethnicity, nation, citizenship education, and intercultural competence as they pertain to applied linguistics.

The primary unit of analysis in applied linguistics, **discourse**, is central to most applied linguistic investigation, and therefore discourse is integral to many of the entries. In this topic area, compiled by Sigrid Norris, entries define discourse as well as the key concepts

applied linguists use to study discourse. Hand in hand with discourse, **pragmatics** is studied to reveal how language users make and interpret meaning in context through language and accompanying nonverbal signals. Marta González-Lloret has included in this topic area entries that explore the aspects of pragmatics that are important in applied linguistics research. Because pragmatics intersects with the technical affordances language users have at their disposal, communication technology comes into play in a number of the entries in this area. However, because of the extensive use and effects of technology in communication, an area devoted to **multimodal communication** has also been compiled. Sigrid Norris developed this area composed of entries that demonstrate the unique and important interface between technology and the linguistic choices language users can make as well as how those choices are realized in technology-mediated form. Entries also cover analytic approaches to the study of how language users make meaning through a combination of language and other semiotic systems.

Grammar is the area of study most central to linguistics, and therefore this is the area in which an enormous set of possibilities exists for inclusion in the *Encyclopedia*. In keeping with Corder's principle of making selections through the applied linguist's eye, Karin Aijmer has crafted a set of entries that covers the important issues and perspectives on grammar in applied linguistics research. In dealing with grammar in the real world, for example, applied linguists need to distinguish "descriptive" and "prescriptive" grammar. In their work on language use, applied linguists are much more concerned with functional grammar, and conversation grammar in particular, than with theoretically abstract formulations of grammar.

Lexis is another area that has been studied from many different perspectives in linguistics, and therefore here too the area editors Brent Wolter and Paul Meara have carefully selected those perspectives on lexis that pertain to applied linguistics. They have identified an important applied linguistic view as one that sees vocabulary in connection with the linguistic context in which words are used and understood. Such contexts are needed to account for the vocabulary choices made by language users in real time. In fact, through the entries in this section readers will see how linguistic description from an applied linguistic lexical perspective makes it difficult to sustain a division between lexis and grammar.

In the topic area of **phonetics and phonology**, John Levis and Murray J. Munro have identified entries that cover applied linguists' use of analytic perspectives on the physical aspects of speech production in addition to the functional and systemic organization of sounds in particular languages. Analysis of speech is critical for the study of such areas of applied linguistics as second language learning and teaching and language assessment. These and more phonology-related problems are included in this area.

Approaches to Language Use and Second Language Acquisition

This category contains entries on particular approaches used to study problems of interest to applied linguists, which pertain to language use and acquisition of an additional language. Each of these areas represents a way of approaching a language-related problem which requires the analyst to take a particular view of language. The research methods connect with one or more other disciplines such as sociology, psychology, or rhetoric. Entries explain epistemological bases, disciplinary links, research methods, and findings.

An empirical, and oftentimes quantitative, approach to the study of language in texts, **corpus linguistics** aims to describe linguistic choices that language users make in constructing their oral and written communication. In contrast to native-speaker intuition or clinically elicited samples of language, the basis for linguistic generalizations made by corpus linguists is linguistic patterns found in large collections of relevant language samples. The source of the data is the basis for claims that findings are authentic and generalizable.

As a consequence, such linguistic descriptions are taken to be useful to applied linguists who are concerned with language as it is used in authentic communication. Michael Stubbs and Dorothea Halbe have gathered entries that explain issues, practices, and findings from corpus linguistics.

An empirical, qualitative approach to the study of language, **conversation analysis** investigates how language users organize naturally occurring social interactions in order to accomplish social actions through talk and bodily conduct such as hand gestures and eye gaze. Rather than generalizability, the claim is that such research provides an accurate description of how language is used to accomplish human social action in specific contexts. Johannes Wagner and Kristian Mortensen have collected entries that present findings from research on conversation analysis in addition to the use of those results and the philosophical basis of this line of inquiry for many areas of applied linguistics.

In contrast to the descriptive stance of both corpus linguistics and conversation analysis is the explicitly ideological basis of **critical discourse analysis**. Critical discourse analysis is an analytic perspective requiring selection of texts for analysis with the aim of demonstrating how the linguistic choices made by authors and speakers create or continue social inequality. The lens for analysis of such texts therefore includes preconceptions about who holds power over whom, in addition to how power might be redistributed. Such an analysis requires effective analysis of the role of language in perpetuating the status quo. Angel Lin has outlined this area through entries that explain the basis for critical discourse analysis as well as describe the analytic methods and findings in some example problems where it has been applied.

Beyond critical discourse analysis, **language ideology** plays a role across applied linguistics, as researchers choose problems to work on and perspectives to use in their analysis. As Cook put it, "Applied linguistics is not simply a matter of matching up findings about language with pre-existing problems but of using findings to explore how the perception of problems might be changed" (Cook, 2003, p. 10). The process of formulating and changing perceptions of problems highlights the ideological nature of some of the choices that researchers make. The entries in this topic area were defined by Patricia Friedrich, Aya Matsuda, and Janina Brutt-Griffler to explain the various dimensions of language ideology and their consequences for applied linguistics research and practice.

One fundamental ideological choice in research on language use is highlighted in the study of **World Englishes**, the varieties of Englishes that are used internationally by people for whom English is not their native language and who do not live in the traditional centers of English use. The applied linguist's study of the actual varieties of Englishes, in contrast to the linguist's study of the idealized native speaker, is highly relevant for issues such as language teaching, language assessment, and language technologies of concern in other areas of applied linguistics. Aya Matsuda, Patricia Friedrich, and Janina Brutt-Griffler developed this section with entries that describe areas of research in World Englishes and their intersection with specific language-related problems.

In view of the central importance of second language teaching and learning in applied linguistics, approaches are needed pertaining specifically to language acquisition. A wide variety of approaches have been undertaken; their key concepts and practices are described in entries in two topic areas of the *Encyclopedia*. In one, the area editor Amy Snyder Ohta has commissioned entries on **social, dynamic, and complexity theory approaches to second language development**. In the other, the area editors Marianne Gullberg and John Williams have commissioned entries on the approaches taken by research on **cognitive second language acquisition**. Entries in the latter area explain researchers' investigations of how the human mind processes language during learning in order to organize and learn the new language. The former includes research that situates human language development within a social interactive process which affects broader aspects of human cognition and

personality. Together these areas of the *Encyclopedia* depict the directions resulting from years of research on second language learning.

Research Methods

Theoretical, analytic, and empirical methods appear throughout the *Encyclopedia*, but in view of the central problem-solving activity of applied linguistics, the *Encyclopedia* organizes and provides greater detail on the nature of the particular research methods that are used in applied linguistics. Most advanced degree programs preparing students to study language problems in the real world would expect students to be familiar with three clusters of research methodologies—analysis of discourse and interaction, qualitative research, as well as quantitative and mixed methods research.

In the section on **analysis of discourse and interaction**, Rodney H. Jones has delineated the domain of research methodological issues, concepts, and practices used primarily in the analysis of synchronous conversation as opposed to monologic text. Entries cover research approaches to investigating how language users select language to construct their social identities, relationships with one another, and realities.

The **qualitative methods** topic area designed by Linda Harklau and Meryl Siegal demonstrates the ways in which qualitative principles and practices shared with others in the social sciences are used in applied linguistics. Entries show how researchers use codes, labels, categorization systems, and narratives, for example, in studying problems in applied linguistics in addition to illustrating the types of problems that are investigated. Qualitative approaches, for example, have helped to document the detail associated with individual language learning and use in a manner that is not revealed in quantitative research.

The topic area of **quantitative and mixed methods** research designed by Joan Jamieson and Kim McDonough demonstrates how quantitative methods from the social sciences are used to address a range of applied linguistics problems in areas such as the study of the effectiveness of particular language teaching practices or the language needs of prospective employees in a business. In addition, it includes entries that explain basic concepts on quantitative research as it is used in applied linguistics. Quantitative approaches have been an important source of new knowledge in applied linguistics as it has been used for describing relevant situations of language use in addition to testing hypotheses about the nature of language use and learning.

Applied Linguistics in the Future

Defining the boundaries of applied linguistics will continue to be a challenge in the future as language contact, language learning, and language technologies expand. More and more people, either by choice or by need, migrate to live in a location where they need to be able to use an additional language. Such movement creates issues that will continue to be recognized as important: How can such transitions be made in a manner that affords new residents and their children a genuine opportunity to succeed? With concerns for human rights more widespread today than ever, such questions demand serious, well-informed attention. Even for people who remain physically within their first language context, their physical linguistic landscape is likely to change as a result of the movement of others; moreover, the Internet will continue to create opportunities for connections across time and space in a manner that will continue to change the way people communicate. The language–technology interface is an area of constant evolution as new forms of communication are taken up by individuals who invent new uses for them. The opportunities for studying human communication will continue to expand. These continuing changes in the external conditions of language use will be accompanied by expanded approaches to

research in applied linguistics, connecting to fields such as neuroscience, computer science, rhetoric, and political science.

Because of the dynamic nature of applied linguistics, the *Encyclopedia of Applied Linguistics* was designed to accommodate such changes in the future. The online format of the *Encyclopedia* will allow for updating and reshaping twice a year. This process of evolution will be guided by the international community of applied linguists that has engaged so productively in shaping the first edition in addition to new applied linguists with new ideas to offer. Numerous suggestions for additional entries have been received, and the first update is under way as research has continued apace during development of the *Encyclopedia*. We are dedicated to keeping the *Encyclopedia* current, and to making it available in different formats, to meet the needs of scholars and students in applied linguistics in addition to those who work with language-related problems beyond applied linguistics.

Area Editors

Karin Aijmer is professor emeritus of English linguistics at the University of Gothenburg, Sweden. Among her publications are *Conversational Routines in English: Convention and Creativity* (1996), *English Discourse Particles: Evidence From a Corpus* (2002), *The Semantic Field of Modal Certainty: A Corpus-Based Study of English Adverbs* (2007, with Anne-Marie Simon-Vandenberg). She is coeditor of *English Corpus Linguistics: Studies in Honour of Jan Svartvik* (1991), *Discourse Patterns in Spoken and Written Corpora* (2004), and *Pragmatic Markers in Contrast* (2006). Her work on pragmatics and discourse, learner English, and contrastive linguistics has appeared in *Journal of Pragmatics*, *Linguistics*, *Functions of Language*, *International Journal of Corpus Linguistics*, *Journal of Nordic Linguistics*, and *Studia Linguistica*.

Claudia V. Angelelli is professor of Spanish linguistics at San Diego State University, USA. Her research focuses on cross-cultural communication, specifically on the role of the interpreter and translator as a language mediator. She is the author of *Medical Interpreting and Cross-Cultural Communication* (2004) and *Revisiting the Interpreter's Role: A Study of Conference, Court, and Medical Interpreters in Canada, Mexico and the United States* (2004). She has recently edited a special issue for the *International Journal of the Sociology of Language* entitled *Translators and Interpreters: Geographic Displacement and Linguistic Consequences*. She has coedited *Testing and Assessment in Translation and Interpreting Studies* (2009, with Holly Jacobson). Her work on interpreting and applied linguistics appears in the *Annual Review of Applied Linguistics*, *Critical Link*, *Interpreting*, the *International Journal of the Sociology of Languages*, *META*, *The Translator*, and *TIS*. She is a coauthor of the "California Healthcare Interpreting Association's Ethical Principles and Standards of Practice." She is the president of the American Translation and Interpreting Studies Association and the director of the Coalition of Distinguished Language Proficiency Centers, and an advisor for the National Council of Interpreters in Healthcare and for *Hablamos Juntos*. She served as director for the American Translators Association for six years. Currently she is the World Project leader for the ISO Standards on Community Interpreting.

Brian Baer is professor of Russian and translation studies at Kent State University, USA. He is coeditor of Vol.12 of the *American Translators Association Scholarly Monograph Series* and *Beyond the Ivory Tower: Re-Thinking Translation Pedagogy* (2003), and editor of *Contexts, Subtexts, Pretexts: Literary Translation in Eastern Europe and Russia* (2011). He is the author of *Other Russias: Homosexuality and the Crisis of Post-Soviet Identity* (2009) and the founding editor of the journal *Translation and Interpreting Studies* (John Benjamins). His translation of *No Good Without Reward: Selected Works of Liubov Krichevskaya* is forthcoming in the series *Other Voices in Early Modern Europe* (University of Toronto Press).

Jasone Cenoz is professor of research methods in education at the University of the Basque Country, Spain. Her research focuses on multilingual education, bilingualism, and multilingualism. She is the editor (in collaboration with Ulrike Jessner) of the *International Journal of Multilingualism*. Her publications include *Teaching Through Basque* (2008, as a special issue of *Language, Culture and Curriculum*), *The Multiple Realities of Multilingualism* (2009, coedited with Elka Todeva), *Towards Multilingual Education* (2009), and *Focus on Multilingualism in School Contexts* (2011, coedited with Durk Gorter as a special issue of *The Modern Language Journal*).

2 AREA EDITORS

Carol A. Chapelle is distinguished professor of liberal arts and sciences and professor of TESL/applied linguistics at Iowa State University, USA. Her research explores issues at the intersection of computer technology and applied linguistics. Her books on technology and language include *Computer Applications in Second Language Acquisition* (2001), *English Language Learning and Technology* (2003), and *Tips for Teaching With CALL* (2008, with Joan Jamieson). Her books focusing on language assessment and research methods include *Assessing Language Through Computer Technology* (2006, with Dan Douglas), *Inference and Generalizability in Applied Linguistics* (2006, coedited with Micheline Chalhoub-Deville and Patricia Duff), *ESOL Tests and Testing* (2005, with Stephen Stoenoff), and *Building a Validity Argument for the Test of English as a Foreign Language* (2008, with Mary K. Enright and Joan Jamieson). She is coeditor of the *Cambridge Applied Linguistics* series. She is past president of the American Association for Applied Linguistics (2006–7) and former editor of *TESOL Quarterly* (1999–2004). She was awarded the 2012 Lifetime Achievement Award in Language Testing by the University of Cambridge and International Language Testing Association and the 2012 Samuel J. Messick Memorial Lecture Award by Educational Testing Service.

Thomas Cobb is associate professor of applied linguistics in the Département de didactique des langues at the Université du Québec à Montréal in Canada. His research in language learning and technology has appeared in *System*, *Language Learning and Technology*, *Reading in a Foreign Language*, and *Calico*. His practical contribution, the Compleat Lexical Tutor Web site for data-driven language learning on the Web (www.lextutor.ca), is widely used.

Ulla Connor is Chancellor's Professor of English, Barbara E. and Karl R. Zimmer Chair in Intercultural Communication, and director for the Indiana Center for Intercultural Communication at Indiana University-Purdue University Indianapolis (IUPUI), USA. She is author of *Intercultural Rhetoric in the Writing Classroom* (2011) and *Contrastive Rhetoric* (1996), and coauthor of *Discourse on the Move: Using Corpus Analysis to Describe Discourse Structure* (2007, with D. Biber and T. A. Upton). Her work on second language writing and intercultural discourse has appeared in *English for Specific Purposes*, *English for Academic Purposes*, *Studies in Second Language Acquisition*, *TESOL Quarterly*, *Journal of Second Language Writing*, *Text and Talk*, and *Communication & Medicine*.

Patricia Friedrich is associate professor of linguistics/rhetoric and composition at Arizona State University, USA. She is the author of *Language Negotiation and Peace: The Use of English in Conflict Resolution* (2007) and editor of *Teaching Academic Writing* (2009). Her work on World Englishes, peace linguistics, and critical applied linguistics has appeared in *World Englishes*, *International Journal of Applied Linguistics*, *Harvard Business Review*, *International Multilingual Research Journal*, and *English Today* among others.

Marta González-Lloret is associate professor of Spanish at the University of Hawai'i at Mānoa, USA. Her work on pragmatics is closely tied with the areas of SLA and CALL and has recently appeared in *CALICO*, and in the volumes *Speech Act Performance: Theoretical, Empirical and Methodological Issues* (by Martínez-Flor & Usó-Juan, 2010) and *Conversation Analytic Studies of L1 and L2 Interaction, Learning, and Education* (by Kasper & Nguyen, 2009).

Durk Gorter is Ikerbasque research professor at the University of the Basque Country, Spain. He conducts research on multilingual education, European minority languages, and linguistic landscapes. His publications include *Multilingual Europe: Facts and Policies* (2008, coedited with Guus Extra), *Linguistic Landscape: Expanding the Scenery* (2009, coedited with Elana Shohamy), *Focus on Multilingualism in School Contexts* (2011, coedited with Jasone Cenoz as a special issue of *The Modern Language Journal*), and *Minority Languages in the Linguistic Landscape* (2012, coedited with Heiko Marten and Luk Van Mensel).

Nadja Grbic has studied linguistics and Slavic languages and is assistant professor at the Department for Translation Studies at the University of Graz, Austria. She teaches translation and interpretation studies and is currently preparing her postdoctoral dissertation (*Habilitation*) on the construction of signed language interpreters as an occupational group in Austria. Research topics include signed language interpreting, social issues of translation and interpreting, translation history, feminist translation, and scientometrics. She has conducted several research projects on signed language interpreting and signed language lexicography, and developed a five-year full-time training program for signed language interpreters at university level, which started in the autumn of 2002 in Graz.

Marianne Gullberg is professor of psycholinguistics, director of the Humanities Lab at Lund University, Sweden, and cofounder of the Nijmegen Gesture Centre, at the MPI for Psycholinguistics, the Netherlands. She is the editor or coeditor of special issues on the role of gesture in SLA (e.g., *IRAL*, 2006; *SSLA*, 2008, with S. G. McCafferty), and coeditor of volumes on *The Cognitive Neuroscience of SLA* (2006, with P. Indefrey), *The Earliest Stages of Language Learning* (2010, with P. Indefrey), and *Gestures in Language Development* (2010, with K. de Bot). Her work on multilingual and multimodal processing has appeared in *Bilingualism: Language & Cognition*, *Brain & Language*, *Language Learning*, *SSLA*, *SLR*, and *IRAL*, among others, and in numerous book chapters.

Dorothea Halbe is postgraduate research assistant and lecturer in English linguistics at the University of Trier, Germany. Her work on business discourse and speech acts has appeared in *Text & Talk* and the *Journal of Business Communication*.

Linda Harklau is professor in the TESOL and world language education program and linguistics program at The University of Georgia, USA. Her research focuses on second language academic and literacy development in adolescent and young adult immigrants. She is coeditor of books including *Generation 1.5 Meets College Composition: Issues in the Teaching of Writing to U.S-Educated Learners of ESL* (1999, with Kay M. Losey and Meryl Siegal), *Generation 1.5 in College Composition: Teaching Academic Writing to U.S.-Educated Learners of ESL* (2009, with Mark Roberge and Meryl Siegal), and *Linguistic Minority Students Go to College: Preparation, Access, and Persistence* (2012, with Yasuko Kanno). She also teaches and publishes regularly in the area of qualitative research theory and methods in applied linguistics, particularly participant observation and longitudinal case studies. She was a contributing author to *TESOL Quarterly's* 2003 Qualitative Research Guidelines. Her work has appeared in *TESOL Quarterly*, *Linguistics and Education*, *Educational Policy*, *Journal of Literacy Research*, *Journal of Second Language Writing*, *Foreign Language Annals*, *Critical Inquiry in Language Studies*, and *Anthropology and Education Quarterly*.

Joan Jamieson is professor of English at Northern Arizona University, USA, where she teaches courses in research methods and statistical applications for applied linguistics. Her recent work in language testing and CALL has appeared in *Educational Measurement: Issues and Practice*, *System*, and the *Handbook of Research in Second Language Teaching and Learning*. Vol.2 (2011).

Rodney H. Jones is associate head of the Department of English at City University of Hong Kong. He is coauthor of *Intercultural Communication: A Discourse Approach* (3rd ed., 2012, with Ron and Suzie Wong Scollon), coauthor of *Understanding Digital Literacies: A Practical Introduction* (2012, with Christoph A. Hafner), and author of *Discourse Analysis: A Resource Book for Students* (2012). His work on mediated discourse analysis and health communication has been published widely in international journals.

Krzysztof Kredens received his MA in English studies and PhD in English linguistics from the University of Lodz, Poland. He is lecturer in applied linguistics in the School of

4 AREA EDITORS

Languages and Social Sciences at Aston University, UK, where he teaches undergraduate and postgraduate courses in linguistics. He has published and presented widely on socio-legal applications of linguistics; he has coedited *Language and the Law: International Outlooks* (2007, with Stanisław Goźdz-Roszkowski). Krzysztof is deputy director of Aston University's Centre for Forensic Linguistics, member of the executive committee of the International Association of Forensic Linguists and director of the International Summer School in Forensic Linguistic Analysis.

Eva Lam is associate professor of learning sciences at Northwestern University, USA. She studies the social contexts of language learning, new literacies, language varieties, and socialization practices in new media environments. Her work has been published in peer-reviewed journals such as *Reading Research Quarterly*, *TESOL Quarterly*, *Language and Education*, *Review of Research in Education*, *Language Learning and Technology*, and *E-learning and Digital Media*, and in edited volumes including *Computer Assisted Language Learning* (2009) and *Handbook of Research on New Literacies* (2008).

John Levis is associate professor of TESL and applied linguistics at Iowa State University, USA. He is coauthor of *Pronunciation for a Purpose* (2012, with Greta Muller Levis), and organizer and coeditor (with K. LeVelle) of the Pronunciation in Second Language Learning and Teaching Conference (apling.public.iastate.edu/PSLLT/2009). His work on pronunciation teaching and intonation has appeared in *TESOL Quarterly*, *Applied Linguistics*, *TESOL Journal*, *ELT Journal*, *Language Awareness*, *World Englishes*, *System*, and *The Annual Review of Applied Linguistics*.

Angel Lin is associate professor of English language education at the University of Hong Kong. She has co/authored and co/edited six research books, including *Problematizing Identity: Everyday Struggles in Language, Culture, and Education* (2008) and *Race, Culture, and Identities in Second Language Education* (2009, with Ryuko Kubota). Her work on language, discourse, and identity has appeared in *Linguistics and Education*, *TESOL Quarterly*, *Journal of Gender Studies*, and *Inter-Asia Cultural Studies*.

Joseph Lo Bianco is professor of language and literacy education in the Graduate School of Education at the University of Melbourne, Australia. He is president of the Australian Academy of the Humanities. His work on language policy and planning has appeared in *Language Policy*, *Language Problems and Language Planning*, and *Current Issues in Language Planning*.

Aya Matsuda is assistant professor of English at Arizona State University, USA, where she teaches courses in applied linguistics. Her primary research focus has been the global spread of English, its use as an international language, and its implications for pedagogy. Her work has appeared in leading journals including *World Englishes*, *TESOL Quarterly*, and *Written Communication*, as well as in a number of edited collections.

Kim McDonough is associate professor and Canada Research Chair in Applied Linguistics at Concordia University, Canada. Her work on second language acquisition has appeared in *Studies in Second Language Acquisition*, *Language Learning*, and *The Modern Language Journal*.

Kristian Mortensen is a postdoctoral researcher at the University of Luxembourg. His research focuses on social interaction and multimodality in ordinary conversation and institutional interaction, in particular classroom interaction. His work has appeared in journals including *Discourse Processes* and *Journal of Applied Linguistics*.

Murray J. Munro is professor of linguistics at Simon Fraser University, Canada. His research on applied phonetics, much of it carried out with his colleague Tracey M. Derwing, has

appeared in such journals as *Applied Linguistics*, *Journal of the Acoustical Society of America*, *Language Learning*, *Journal of Phonetics*, *Speech Communication*, and *Studies in Second Language Acquisition*. With Ocke-Schwen Bohn, he published *Language Experience in Second Language Speech Learning* in 1997.

Sigrid Norris is associate professor in communication studies and director of the Multimodal Research Centre at Auckland University of Technology, New Zealand. She is author of *Analyzing Multimodal Interaction: A Methodological Framework* (2004) and *Identity in (Inter)action: Introducing Multimodal Interaction Analysis* (2011); and is coeditor of *Discourse in Action: Introducing Mediated Discourse Analysis* (2005, with Rodney H. Jones) and editor of *Multimodality in Practice: Investigating Theory-in-Practice-Through-Methodology* (2011). Her primary research interests are multimodal theory and methodology and the study of identity.

Amy Snyder Ohta is associate professor of applied linguistics and Japanese at the University of Washington, USA. She is coeditor of *Japanese Applied Linguistics* (2008, with Junko Mori) and author of *Second Language Acquisition Processes in the Classroom: Learning Japanese* (2001). Her work has also appeared in journals such as *Applied Linguistics*, *System*, *Japanese Language and Literature*, and *The Journal of Pragmatics*, and in various edited volumes.

Lourdes Ortega is professor of applied linguistics at Georgetown University, USA. She is the author of *Understanding Second Language Acquisition* (2009) and editor of *Critical Concepts in Linguistics: Second Language Acquisition* (2010). Her work on second language acquisition and foreign-language education has appeared in *Applied Linguistics*, *Language Learning*, *The Modern Language Journal*, and *Studies in Second Language Acquisition*.

Lia Plakans is assistant professor in foreign-language/ESL education at the University of Iowa, USA. Her research focuses on assessing integrated skills, test use, and connections in L2 reading and writing. She teaches graduate courses in language assessment, language planning and policy, and second language learning. Lia has been an English-language educator in Texas, Ohio, Iowa, and Latvia.

Karen Risager is professor in cultural encounters at Roskilde University, Denmark. She is the author of *Language and Culture: Global Flows and Local Complexity* (2006) and *Language and Culture: From a National to a Transnational Paradigm* (2007), and coeditor of *Culture in Language Learning* (2006, with H. L. Andersen and K. Lund).

Meryl Siegal teaches English at Laney College in Oakland, California, USA. She is coeditor of *Generation 1.5 in College Composition: Teaching Academic Writing to U.S.-Educated Learners of ESL* (2009, with Mark Roberge and Linda Harklau). Her work on Japanese as a second language and second language pragmatics has appeared in the *Journal of Applied Linguistics*.

Michael Stubbs has been professor of English linguistics at the University of Trier, Germany, since 1990. He was previously professor of English at the Institute of Education, University of London, and lecturer in linguistics at the University of Nottingham, UK. He has been chair of the British Association for Applied Linguistics, and has published widely on applied linguistics and corpus linguistics.

Thomas A. Upton is professor of applied linguistics/TESOL and chair of the Department of English at Indiana University-Purdue University Indianapolis (IUPUI), USA. He is the author of *Reading Skills for Success: Guide to Academic Texts* (2004) and coauthor of *Discourse on the Move: Using Corpus Analysis to Describe Discourse Structure* (2007, with D. Biber and U. Connor). His work on ESP, L2 reading, and discourse analysis has appeared in *Discourse Studies*, *Journal of Corpus Linguistics*, *Language Testing Journal*, *Studies in Second Language Acquisition*, and *English for Specific Purposes*.

Johannes Wagner is professor at the Institute of Business Communication and Information Science at the University of Southern Denmark. He is currently involved in three larger projects: He directs a project on Electronic CA databases which makes first and second language conversations as well as high-quality CA transcriptions available for the research community (www.talkbank.org/samtalebank). He is part of the SPIRE research center on participatory innovation (www.sdu.dk/spire) and of CALPIU (www.calpiu.dk), the Research Center for Cultural and Linguistic Practices in the International University.

John Williams is reader in applied psycholinguistics at the University of Cambridge, UK. He is coeditor of *Statistical Learning and Language Acquisition* (forthcoming, with Patrick Rebuschat). His research on cognitive aspects of second language learning and processing has appeared in *Studies in Second Language Acquisition*, *Language Learning*, *Second Language Research*, *Applied Psycholinguistics*, *Bilingualism: Language and Cognition*, and *Lingua*.

Brent Wolter is associate professor of English and director of the TESOL program at Idaho State University. His work on vocabulary has appeared in journals such as *Applied Linguistics*, *Second Language Research*, *Studies in Second Language Acquisition*, and *System*.

Abercrombie, David

ADAM BROWN

David Abercrombie (1909–1992) was born into a family with a literary heritage—his father was the poet Lascelles Abercrombie. When World War I began, his family moved to Liverpool, where his father subsequently became a lecturer at Liverpool University and David was educated at Liverpool College. His father was then appointed professor of English literature at Leeds University and David attended Leeds Grammar School. He went on to Leeds University where he graduated with a third-class honours BA in English. While living with his parents in London, he worked on an MA on i-mutation, which he never completed. As Ladefoged (1997, p. 85) notes, he “never set much store on academic credentials.” His father served on the BBC Advisory Committee on Spoken English with George Bernard Shaw and Daniel Jones. When Jones was told of David’s interest in speech, he mentored him for the next seven years at University College London (UCL). As a result, David became involved in topics such as spelling reform and the teaching of English to native speakers of other languages.

During two years as an assistant in a Paris lycée, Abercrombie attended classes at the Phonetics Institute at the Sorbonne. On returning to the United Kingdom in 1934 his first appointment was as an English teacher at the London School of Economics (LSE). Just before and during World War II, he taught in Eastern Europe, Greece, Cyprus, and Egypt. After the war, he returned to the LSE, and then Leeds University. During this time, he was strongly influenced by teachers and colleagues including J. R. Firth, Ida Ward, Hélène Coustenoble, Bronisław Malinowski, C. K. Ogden, and Arthur Lloyd James. However, the strongest of these influences was Daniel Jones, the popularizer of the cardinal vowel system. Jones was famous for having little in the way of small talk. On their first meeting, Jones said “How do you do? Come in and sit down. Would you please say a voiced bilabial implosive?” (Abercrombie, 1991, p. 38). Later, after Abercrombie had been working in Jones’s UCL department for a time, it is reported that J. R. Firth asked Jones what he thought of Abercrombie. Jones’s reply was “Well, his Cardinal Three’s not very good” (Abercrombie, 1991, p. 3).

In 1948, he was invited by the University of Edinburgh to establish a Department of Phonetics, where he was appointed professor in 1964 and remained until his retirement in 1980. Notable among his students were Peter Ladefoged, author of *A Course in Phonetics* (2006), and John Laver, author of *Principles of Phonetics* (1994).

Academically, he is remembered for the breadth of his contribution to the field of phonetics, as evidenced by the following aspects.

Phonetics as a Discipline

Abercrombie can be credited with having established phonetics as a separate university discipline. The Edinburgh Phonetics Department was the only one in the United Kingdom outside London. Abercrombie established a one-year Ordinary Course in Phonetics, emphasizing the fundamental importance of ear-training and production (the ability to hear and pronounce sounds, including small differences in sounds, sounds in various accents of

English, and sounds in non-English languages). He also personally taught much of this course, as he “approved of the Scottish tradition that the Professor should teach first-year students” (Kelly, 1993, p. 69). As Laver and Asher (1992) note, “Abercrombie was by any standards a great teacher, demanding, and inspirational.” His broad view of phonetics is embodied in *Elements of General Phonetics* (Abercrombie, 1967).

History of Phonetics

While he was a student in London, Abercrombie read widely in the British Museum about the history of phonetics, assembled a personal collection of early works, and became the leading authority on the subject. In particular, he synthesized the various strands of enquiry and appreciated the continuities over the previous five centuries (Abercrombie, 1949, 1965a, pp. 45–75). In acknowledgment of this, a festschrift for him was entitled *Towards a History of Phonetics* (Asher & Henderson, 1981).

Transcription Systems

The subject of one of Abercrombie’s earliest writings (Abercrombie, 1937, 1965a, pp. 92–107) was Isaac Pitman, well-known nowadays as a pioneer in shorthand. Pitman is often described as a phonographer, that is, someone engaged in phonetics-based spelling. Pitman had established the Phonetic Institute and a *Phonetic Journal* at Bath, and produced a phonetic system that was the basis for his shorthand. Abercrombie developed a comprehensive theory of phonetic transcription systems (Abercrombie, 1964a), making various distinctions including simple (using the most Romanic set of letter-shapes) versus comparative transcription, allophonic versus phonemic (using the smallest number of symbols) transcription, symbols versus conventions (the tacit rules interpreting what the symbols stand for), and quality versus quantity transcriptions for certain English phonemes, for example whether the distinction between the vowels of *feet* and *fit* should be represented qualitatively by using different symbols (/i/ and /ɪ/) or quantitatively by using a length mark (/i:/ and /i:/) or both (/i:/ and /ɪ/).

Spelling Reform

Related to his interest in transcription was an interest in English spelling, arising from two main people. One was Daniel Jones, who was the president of the Simplified Spelling Society (Abercrombie later became a vice-president), and after 1945 wrote all his personal letters in a reformed system known as New Spelling (or Nue Spelling). The other was Robert Bridges, the Poet Laureate, whom he advised on a reformed spelling system he was devising for the publication of his collected essays; Abercrombie was well aware of the reformed systems that had been proposed earlier (Abercrombie, 1981).

Rhythm of English Speech

Abercrombie is perhaps best known for his contribution to the study of the rhythm of English speech (see Abercrombie, 1964b, 1964c, 1965a, pp. 16–25). In this respect he was influenced no doubt by the metrics of poetry, the profession of his father. Basic dichotomies were proposed (a) between those movements of the intercostal muscles that produce syllables, and those that produce stressed syllables, and (b) as a result, between those languages

and accents where syllables occur at roughly equal intervals of time (syllable-timed languages) and those where stressed syllables occur regularly (stress-timed languages). Stress-timed languages such as English could thus be analyzed into feet, as traditionally used in the analysis of poetry. These distinctions are questioned by many writers since conclusive instrumental substantiation is difficult to find. However, Abercrombie had proposed regular feet as a phonological, rather than phonetic, property of English speech.

Voice Quality

A less well-known contribution, but one that is equally far-reaching, is that of voice quality (see Chapter 6 of *Elements of General Phonetics*, Abercrombie, 1967; and Laver, 1980). This refers to the long-term settings of the voice box (larynx) and vocal organs (lips, tongue, nasal cavity) that may characterize individual speakers, or be used for effect, such as whisperiness for secrecy.

Instrumental Phonetics

As Ladefoged (1997, p. 89) points out, “Abercrombie did not do much work in the phonetics laboratory himself.” This is not to say that he did not realize the importance of experimental and instrumental techniques in phonetics. He encouraged instrumental phonetics in his Edinburgh department, including PAT (parametric artificial talker), an early project in speech synthesis (creating speech sounds electronically from a nonsegmental input), and purchasing one of the first Kay spectrographs outside the United States. He also wrote an article (Abercrombie, 1957, 1965a, pp. 125–30) on direct palatography, the process of investigating tongue contact with the palate during speech, by spraying the palate with a dark mixture that is then removed by contact with the tongue.

Teaching English Pronunciation

As with many phoneticians before him, Abercrombie’s interest in phonetics was not merely from an academic point of view, but also with a view to its practical application in the teaching of English (and other languages) to foreign learners. His book *Problems and Principles* (1956a) is concerned with various aspects of ELT, including the relevance of phonetics to teachers, the use of transcription, and the importance of intelligibility in setting targets for learners. Despite being himself a Received Pronunciation (RP) speaker, he accorded it no special status, noting disapprovingly that it often represented an elitist accent-bar (analogous with color-bar) for employment advancement (Abercrombie, 1956b, 1965a, pp. 10–15, 1965b). Indeed, he often stated that, from a phonetic perspective, Scottish English pronunciation avoided many of the negative connotations that RP carries in some parts of the world and suggested that, being phonetically simpler, it was a viable alternative model for learners.

All those who met him remember him as a very genial man. Laver and Asher (1992) describe him as “gentle, wise and caring.” He was hospitable and he and his wife, Mary, held an open house on Sunday mornings for staff, students, and visiting academics. His students (including myself) were all profoundly influenced by him. For instance, Peter Ladefoged, who advised on the phonetic aspects of the film *My Fair Lady*, included the message “Honour to David Abercrombie,” written in the phonetic script devised by Henry Sweet, in the credits.

Academies of the Arabic Language and the Standardization of Arabic

DINHA T. GORGIS

The term *academy*, as conceptualized in the Arab world today, is often associated with Bayt al-Hikmah (lit. House of Wisdom), a major intellectual center created by al-Ma'mun in 830 CE. The story of the Arab Language Academy (ALA) cannot be appreciated without taking into consideration Arab achievements in the intellectual domain during the two centuries (c. 750–950) that can be said to be the climax of the Arab world's medieval period, the so-called Islamic Golden Age, which is thought to have started by the middle of the eighth century with the transfer of the Abbasid capital from Damascus to Baghdad. Conservatives often take this period as the impetus for present-day language standardization and cultural revival.

As widely circulated in the relevant literature the House of Wisdom, chaired by the great translator Hunayn Ibn Ishaq (known in the West as Johannitius), became the unrivaled center for science, philosophy, medicine, engineering, and education (cf. Tschanz, 2003). However, the Abbasid rule in Baghdad went into decline with the rise in power of the Turkish army created by the Caliphs and ended in 1258 when the Mongols sacked Baghdad. The Abbasids resumed rule in Egypt in 1261 up until 1519 when power was formally transferred to the Ottomans and the capital moved to Istanbul. During Ottoman rule, which lasted from 1299–1923, the prestige of Arabic dwindled due to the serious threat from Turkish—the administration and the army were mainly run in Turkish, sometimes alongside Arabic in the Arab territories—and French, because of Napoleon's expedition to Egypt in 1798.

Traditionally, Arabic was taught in mosques, houses annexed to mosques, or in other private places. That is, there had been no formal schools run in Arabic. But just a few years before the fall of the Ottoman Empire and the end of World War I, the linguistic scene dramatically changed in the Arab world (cf. Shraybon, 1999). A number of enthusiastic groups of Egyptian intellectuals, who feared that Arabic was losing ground on the national and international linguistic map, had made several attempts to create a language academy following the example of the House of Wisdom and L'Académie française. It wasn't until 1934 that the first Cairo-based ALA was created, although had Syria established the first Arab Science Academy in Damascus (ASAD) as early as 1919, which played a significant role in Arabizing all official documents previously written mainly in Turkish and sciences written in other languages (cf. Fayed, 2004). Since ASAD was more than a science (and language) academy, in fact a mini-ministry of education and information, it was entrusted with the task of appointing teachers of Arabic in schools and taking care of anything related to the Arabic revival, including translation. Its monthly journal, of which the first issue appeared in 1921, became quarterly after 1949. Prior to its renaming as the ALA in Damascus in 1967, ASAD was only a branch of the Cairo-based ALA, following the union between Syria and Egypt in 1960. The Iraqi Academy for Sciences (IAS) was founded in 1947, but the union of all three was not inaugurated and recognized globally until 1971. This union, named the Arab Scientific and Linguistic Academies' Union (ASLAU), commonly known as ALA for short, is based in Cairo. Since then other regional academies

have joined ASLAU, namely Lebanon, Jordan, Morocco, Tunisia, Libya, Sudan, Palestine, and Algeria, in addition to the Arab League Educational Cultural and Scientific Organization (ALECSO).

Prior to the independence of Arab countries, Arabization was understood as a movement essentially geared toward converting anything Ottoman, that is, Turkish, and English or French into Arabic and taking national pride in the process. In fact, calls for Arabization had then been exploited politically as outcries for both the recognition of national identity and autonomy of the states. Since their independence, and as literacy steadily increased in the Arab world, the meaning of Arabization has become more complex (cf. Sieny, 1988, p. 177). Primarily, it has meant institutionalizing Arabic, that is, maximizing the official usage of Arabic particularly in education, administration, and the media as well as keeping pace with the modern world in Arabic. As such, Arabization and modernization (basically Westernization) have come to be understood as complementary issues (but see Abdulaziz, 1986). Secondly, Arabization also refers to the spread of Arabic globally.

Whereas the former usage of Arabic necessitates nationally based activities, such as translation and rendering all educational systems into Arabic, the latter goes beyond the Arab territories, especially in Africa, in order to Arabize Roman scripts and help spread Islam. Standardization, on the other hand, entails both modernization and Arabization in that order. The quest for assimilating foreign borrowings, such as those of modern science and technology, into Arabic is one aspect of modernization, but the problem of Arabizing or standardizing borrowed concepts from other cultures, mainly from English and French, will remain unresolved in the long run. Understandably, Arabization is much easier than standardization simply because if a translator cannot find an equivalent term in Standard Arabic, transliterating a Roman form, for example, into Arabic would be necessary. Still, borrowing is widely believed to threaten the standard form, if not the existence of Arabic, no matter how it is accommodated. But what is more threatening is the historical conflict between the colloquial and the standard.

For over a century, there have been numerous attempts to simplify the grammar and lexicon of Classical Arabic in which the Koran and pre-Islamic literature are written. A few other attempts worked in the opposite direction, that is, to elevate a selected spoken variety to the status of a standard. The former attempts, mainly celebrated by lexical reform due to contact with the West (cf. Emery, 1983), produced what we call today Modern Standard Arabic (MSA), which is mostly written or occasionally read out, whereas the latter attempts generated what one may term Middle (or Educated) Arabic, an amalgam of both MSA and a regional spoken variety, and hence conversational rather than written. The observations put elegantly by Altoma (1970, pp. 695–700) four decades ago are true of present-day practices. So against this gloomy picture, standardization becomes an impossible task despite the fact that teachers are officially instructed to use MSA. It goes without saying that preaching, or dictating rules of use, overrides practicing. This perhaps explains why the Saudis are not happy about the achievements of Arab academies.

All ASLAU members, however, have agreed a common agenda, already acknowledged by individual members since their foundation and enriched through several meetings in different Arab capitals. From the beginning, ASLAU has called for updating Arabic; searching for unified terminology based on heritage; translating from mainly English and French; verifying critical texts; simplifying Arabic textbooks, especially those of syntax at all levels; discouraging the use of vernaculars in the media; building a monolingual dictionary to be used as a reference at schools; compiling specialized bilingual and trilingual glossaries and dictionaries for most sciences, including linguistics; Arabizing curricula, especially medical; and enriching children's libraries.

Arab language purists (perfectionists) have since the creation of first private language academies in Egypt been persistently campaigning for political decisions which would

institutionalize standardization. Such attempts amount to asking for the rescue of an endangered species, as if Arabic were dying out or in danger of foreseeable threats. The threats, they believe, are manifold, the most publicized and popularized being

1. globalization and its negative impact on Islam, Arabic culture, and national identity;
2. the spread of vernaculars in mass media and education; and
3. the use of foreign languages in many domains, for example, the family, including baby-sitting, and private schools.

The first potential threat underlies a paradox and a number of pros and cons; for while the West is thought to be marketing English globally, the Arabs have started marketing Islam and culture through Arabic. So far, we are told that 17 African countries have switched from Roman (Latin) script into Arabic (cf. Altwajri, 2004, p. 62).

The main responsibility for this script change policy in African settings has rested with the Coordination Bureau of Arabization (CBA), established in Rabat (Morocco) under the auspices of ALECSO, which has been involved in translating and supervising the translation of technical terms since its creation in 1969. Although CBA is doing its best "to bring some order out of the previous chaos" (Emery, 1983, p. 87), it still faces difficulties, most prominent of which is the conservatism exhibited by the purists and hence a significant delay in the tasks entrusted. Moreover, duplication in terminology creation presents a serious problem, basically arising from the English versus French orientation and geographical distribution of Arab countries, if not political affiliation of the respective states and multifarious judgments of individual translators. However, efforts in this direction continue; a number of other Arab institutions have been recently working laboriously with foreign agencies, under certain agreements, to develop *term banks* (cf. Sieny, 1988, among others), which is, indeed, a promising sign.

Accent Reduction

RON I. THOMSON

The term “accent reduction” is normally used by individuals or businesses offering to help second language (L2) learners reduce or eliminate their foreign accent. These services are provided under what Derwing and Munro (2009) refer to as a business view of accent, and are often premised on the belief that foreign accents are a negative trait, and a detriment to L2 speakers’ ability to establish relationships and find employment. A Google search for the term “accent reduction” results in well over 100,000 hits, primarily linked to Web sites offering courses that promise to rid speakers of a foreign accent, some in as little as 2.5 hours. In this unregulated market niche, no specialized training is required of instructors in accent reduction programs, although some do have backgrounds in English language teaching (ELT) or as speech language pathologists (SLPs). While some accent reduction programs and instructors are well-intentioned, many others appear to be solely profit-driven. This section will contrast accent reduction with related terms and practices, and briefly summarize the perspective of applied linguists and learners.

Related Terminology and Practices

Although the terms “accent modification,” “pronunciation instruction,” and “accent addition” may sometimes be confused with accent reduction, each tends to be used in different contexts, and with different connotations. Accent modification has the most currency in clinical settings, where staff are usually SLPs. In contrast, the term “pronunciation instruction” is most commonly used in ELT contexts, where pronunciation is not a primary focus of attention, and, when taught, is treated as one language skill among many (Breitkreutz, Derwing, & Rossiter, 2001). The term “accent addition” is used in English as an international language (EIL) contexts, by applied linguists and language teachers who advocate limiting pronunciation instruction to those core features that are most important for international communication. “Accent addition” also conveys the ideological stance that to acquire a new language does not require the abandonment of a learner’s identity, but, rather, the addition of a new one (Jenkins, 2004).

Buyer Beware

There is ongoing controversy about the motivation behind many accent reduction programs (Müller, Ball, & Guendouzi, 2000; Schmidt & Sullivan, 2003). Some of the strongest opponents have argued that many accent reduction courses are pure hucksterism, and prey upon unwitting immigrants who are desperate for any strategy that will help them succeed in their new country (Derwing, 2008). A quick examination of promotional materials for accent reduction programs provides strong support for such criticism. For example, one widely advertised company provides a 100% money-back guarantee if a client is unhappy with his or her improvement during the first week. A claim to such rapid improvement contradicts widely accepted research findings that improvement in L2 pronunciation is gradual, taking place over an extended period of time (Piske, MacKay, & Flege, 2001). To an unsuspecting language learner, however, this guarantee may seem compelling. The

2 ACCENT REDUCTION

same company warns potential clients not to be fooled by accent training offered by anyone other than a certified SLP, seemingly adding to the company's legitimacy. In fact, there is no published evidence regarding the efficacy of such accent reduction programs. Rather, claims of improvement are largely based on anecdotal evidence and unverifiable customer testimonials.

Concern has also been expressed that accent reduction programs sometimes treat L2 accent as a clinical disorder (Jenkins, 2004). While professional associations such as the American Speech-Language-Hearing Association (ASHA) (2004) and the Canadian Association of Speech-Language Pathologists and Audiologists (CASLPA) (2008) take an official position that accent is not a disorder, clinical terms are still used to describe it. For example, both ASHA and CASLPA list accent modification as an "elective procedure" and stipulate that this "procedure" should be conducted by qualified SLPs. The clinical view of accent is also often evident in practice. In a survey of 76 ASHA certified, university-based speech clinics offering accent-training courses in 36 states, half reported assessing foreign-accented clients' motor speech ability as part of their diagnostic test (Schmidt & Sullivan, 2003). This test is designed for use in the diagnosis of speech disorders, rather than that of normal speech. In response to criticism, Sikorski (2005) argues for avoiding clinical terminology, and for replacing "patient" with the more business-oriented label "client."

Accent Reduction Training Techniques

Although many accent reduction instructors employ techniques that are commonly used by appropriately trained teachers, others use techniques that are untested, and even bizarre. For example, Derwing (2008) reports that one accent reduction course asks participants to place marshmallows between their lips while reciting "Peter picked a peck of pickled peppers" in order to practice making "p" sounds. Of course, it is quite impossible to produce a "p" when something is blocking lip closure. Another course teaches that the distinction between the sounds "b" and "p" is that speakers use their voice when producing "b," while for "p," speakers should not use their voice. While it appears that this instructor has acquired some phonetic terminology (i.e., "voicing"), she clearly does not understand what this means, and is using the term "voice" in an inappropriate and misleading way. This will likely cause confusion for learners, who will be frustrated in any attempts to make speech sounds without using their voices.

Accent Reduction From an Applied Linguistics Perspective

Applied linguists with an interest in foreign accent generally agree that the aim of instruction should not be to eliminate learners' accents, but, rather, should target specific features that are likely to lead to a loss of intelligibility (Jenkins, 2004; Derwing & Munro, 2009). An often-cited study by Munro and Derwing (1995) provides empirical evidence that the relationship between accent and intelligibility is complex. This research concluded that, despite having a strong foreign accent, some L2 speakers can still be perfectly intelligible. Furthermore, the researchers found that listeners' perceptions of foreign accent is often triggered by segmental errors. Yet there is a broad consensus that suprasegmental errors are more likely to lead to breakdowns in communication, and should therefore be the primary focus of instruction (Levis, 2005; Derwing, 2008). When segmentals are taught, instruction should focus on those phonemic contrasts that occur most frequently in the language (e.g., English "l" and "r"), with less attention to segments that rarely contrast (e.g., English "th" vs. "d").

Some applied linguists also express a concern that pronunciation instruction should be conducted by appropriately qualified teachers. While the most obvious candidates may be those trained to teach English as a second or additional language, research indicates that many such instructors avoid teaching pronunciation, citing a lack of training (Breitkreutz et al., 2001; Macdonald, 2002; Fraser, 2006).

According to Sikorski (2005), a demand for assistance from L2 learners themselves provided the impetus for SLPs to enter the field. Unfortunately, like many ESL instructors, most SLPs also lack appropriate training. For example, in Shriberg and Kent's (2003) popular clinical phonetics text, coverage of accent is limited to two pages in an appendix. Furthermore, most SLPs lack experience with L2 populations. Schmidt and Sullivan (2003) found that, in typical university speech-clinic settings where future SLPs are trained, fewer than 10 clients per year come seeking help with their foreign accent.

Despite a general lack of knowledge about accent and pronunciation by English-language instructors and SLPs, some have obtained training that reflects expert views on accent and pronunciation. They have also developed student materials that reflect these views (e.g., Grant, 2000; Gilbert, 2010).

Accent Reduction and L2 Learners

Behind the debate surrounding accent are the learners themselves, without whom there would be no demand for accent reduction programs. In fact, there are complex social consequences of having an accent, both positive and negative. For example, hearing an accent allows listeners to adjust their speech to better accommodate the accented speakers with whom they are speaking. However, recognition of an accent can also lead to discrimination (Rubin, 2002; Munro, 2003). Müller et al. (2000) argue that denying L2 speakers access to accent reduction programs will perpetuate disadvantages they already face, however unfair those disadvantages may be. Learners themselves often feel the same way. In a discussion of outsourcing the English call-center industry to India, Friedman (2005) describes accent reduction as the price employees are willing to pay for an improved standard of living. Timmis (2002) found that two thirds of 400 English learners surveyed from both English-speaking and non-English-speaking countries desired to speak like a native speaker. In Canada, 95% of immigrants surveyed expressed the desire to have native-like pronunciation (Derwing, 2003). Demand from learners suggests that accent reduction programs will continue to thrive. Given their expertise, applied linguists have a role to play in promoting appropriate research-based approaches to pronunciation instruction that help learners shape realistic goals, and in providing the means to achieve those goals. Until qualified instructors meet this need, the demand for pronunciation instruction will continue to be filled by many who are unqualified to provide such a service.

Acculturation in World Englishes

KAMAL K. SRIDHAR

Linguistically and culturally, all varieties of World Englishes are an interesting and a dynamic phenomenon: interesting, because after years of contact of the native languages with English, distinctive varieties are emerging all around the world; and dynamic, because the English language is constantly evolving and changing in many cultures around the world, as the expressive resources of the English language are constantly being used to express nuances of local cultures and sensibilities. Language acculturation consists of a variety of processes of language change by which a language, not one's own, is modified to serve as an effective vehicle for the expression of one's own sociocultural and cognitive experiences. Acculturation, therefore, signifies one, some, or all of the following processes: introduction of loanwords, idioms, and derivational processes from substratum languages; use of calques, or loan translations of phrases, idioms, constructions; intrasentential mixing of units of different levels of complexity from various languages (code mixing); code switching; introduction of language-specific conventions of speech acts and discourse types; and even poetic conventions from other languages. These processes are often at work in the transformation of a foreign language into a second language.

The original "inner circle" of native speakers has spawned an "outer circle" of users of English in former British and American colonies. The majority of these countries still use English as an official language, and consider it their second language. In addition, there is the "expanding circle," constituting countries like China and Japan, where English has acquired the status of the most favored foreign language and is widely taught in schools. It is the users in the outer circle, however, that have had the greater impact on English in recent decades and have precipitated paradigm shifts. The "nativizing" of English will continue, and these variant forms will continue to generate scholarly interest.

This chapter will focus on the influence of local languages and cultures on English that give rise to distinctive varieties of Englishes around the world. As "Englishization" is not just restricted to phonology, grammar, and lexis, it impacts all levels, including discourse, register, styles, and literary genres in "outer circles" writing in English (see K. Sridhar, 1979; B. Kachru, 1983; S. Sridhar, 1992; Y. Kachru & Nelson, 2006).

Using South Asia as an example, where English has permeated all spheres of life, English words are widespread in many domains, such as education and religion (the rituals and religious services are in Sanskrit, but to accommodate the younger generation, sometimes the explanations are given in English). There are more speakers of English in South Asia than in the USA or UK (B. Kachru, 1986, p. 54).

The languages of South Asia have affected South Asian English in many ways. Since South Asian languages are mostly syllable-timed, it is therefore not surprising that South Asian English has its own syllable-timed rhythm, which is perceived by native speakers of English as a sing-song rhythm. The author will provide a few illustrations of the distinctive lexical, grammatical, and pragmatic features of Indian English, though similar examples exist in other varieties of South Asian English.

Lexical Features

South Asian English is rich and colorful, borrowing extensively from the regional languages spoken in the areas. For a detailed discussion on this topic, see B. Kachru (1983). Words from the local languages express local sensibilities, and are perceived as enhancing the expressive resources of the English language. By the same token, English lexical items are appropriate for use in a range of domains and embedded in other South Asian languages. In all domains, from politics to religion, English words are preferred and used by all South Asians. Here are a few examples from Indian English, as discussed in Gargesh (2006, p. 103): *roti* (unleavened bread), *finger chips* (French fries). “Why can’t our *shaadis* [weddings] be something like, ‘O.K. bring in the *dulha* [groom] and the *dulhan* [bride], their close friends and relatives: dance, eat, have fun, and that’s it’?”

Grammatical Features

In terms of grammar, there are a few characteristics shared by all South Asian users of English. *Reduplication* is a characteristic feature in many languages of South Asia and is used in both spoken and written educated varieties, and includes various classes of words, as in “hot hot coffee,” “small small things,” “to give crying crying” (“incessantly crying”) (B. Kachru 1986, 1994).

Idioms and metaphors are transferred from South Asian languages such as Kannada: “In olden times, *woman just worked like a bullock*” (S. Sridhar, 1996, p. 58; 1992), and “The play had gone bad, *like pickle in the monsoon*” (Roy, 1997, p. 139).

Pragmatic Features

Politeness in Asian society is a conventionalized phenomenon, which is part of the conversational style of South Asian Englishes. In the area of hospitality, it is not sincere enough to say, “Won’t you have some more?” One has to say, “Take only this much, just this much” (i.e., “just this much more”) (Y. Kachru, 2003). Kinship terms such as “sister,” “auntie,” “uncle” are also used, as “Mr.” or “Mrs.” would be considered uppity (K. Sridhar, 1991, p. 311). An example of the use comes in requesting services, such as asking a friend’s mother for a glass of water, with the words “Auntie, could I have a glass of water, please?” The author concluded that non-native speakers have partial linguistic/communicative competence in English in particular domains; they do not need English to perform a great many speech functions for which the mother tongue is typically used (K. Sridhar, 1991, p. 317; 1979).

Code mixing and code switching: Anyone who visits any part of South Asia or Africa will notice the ease with which people switch back and forth between languages (code switching), or insert words, phrases, or long strings of speech from another language into their speech (code mixing). In the case of South Asia, one cannot help but notice it. Even formal newscasts on radio and television are not exempt from it. Here are some examples from television shows devoted to tourism, noted down on July 6, 2002, from ZeeTV, a very popular television station. The extent of code mixing is exemplified in this example:

Yeh lake itna bada hai ki [This lake is so big that you can’t tell] *ki kaha lake khatam hota hai aur akash shuru* [you can’t tell where the lake starts and ends].

Literary Creativity

Literary creativity in South Asian writers writing in English has been extensive, and is on the increase. There have been discussions about whether Indian writers should write in “proper” British or American English, or in their own variety of Indian English.

Conclusion

As is obvious from the above discussion, English occupies a very special position in the lives of South Asians. As has been often said, English is one of the languages South Asians speak in. As used in South Asia, English has been nativized to such an extent that it is considered not a foreign or an alien language.

One should not be left with the impression that the position of English has been accepted unequivocally by all in South Asia. Periodically, there is strong opposition to the continuation of English as the Associate Official language. But, in this age of globalization, recognition of the leadership position of India in the areas of science and technology, and mathematics, which has been possible due to Indians’ proficiency in the English language, has convinced other South Asian countries to introduce English language instruction in the grade schools. English has certainly been instrumental in raising the economic profile of India. Argument opposing English has almost become a moot case. English is clearly here to stay.

Acquisition Planning

GABRIELLE HOGAN-BRUN, CLINTON ROBINSON,
AND INGO THONHAUSER

Acquisition Planning (AP) is concerned with the range of language users and the distribution of literacy. As a form of language management (Spolsky, 2004) it complements and interacts with status planning (which is about the social role or function of a language) and corpus planning (used to modify the structure of a language). This interconnection is particularly evident in multilingual contexts, where (monolingual and bilingual) AP often involves status-linked and ideology-driven language aspects of public legitimization and institutionalization (May, 2001, p. 153). AP can be activated in formal and informal settings, at the macro or micro levels of society, and may involve top-down or bottom-up approaches (Kaplan & Baldauf, 1997). This chapter provides a brief overview of approaches to AP and highlights issues arising in postcolonial, post-Soviet, and European settings, exemplified by some current European frameworks which are particularly active in AP.

The term “AP” goes back to Robert Cooper, who conceived it as being “directed towards increasing the number of users—speakers, listeners, writers, or readers” (1989, p. 33). In expanding on Kloss’s (1969) earlier distinctions between status and corpus planning, his preliminary framework for AP considered foreign language acquisition, reacquisition, and language maintenance of users as overt goals, and opportunities and incentives to learn as means employed to attain this (Cooper, 1989, p. 160). Hornberger’s integrative framework (1994, p. 78) of language planning goals combines approaches taken by Cooper (above), Haugen (1972), and Neustupny (1974) in a matrix that distinguishes between language planning types (i.e., status, acquisition, and corpus planning) and approaches (i.e., policy and cultivation). As AP goals at the (macro) societal language policy level she lists the group, education/school, literature, religion, mass media, and work; at the (micro) level of cultivation planning her focus is on reacquisition, language maintenance, foreign/second language, and shift. Kaplan and Baldauf (1997, pp. 122ff.) use the term “language-in-education planning,” with literacy planning as a subset, to extend mother-tongue knowledge to its written forms through schooling. In their model they list curriculum, personnel, materials, community, and evaluation as key education policy development and implementation areas. Spolsky demonstrates through his language policy paradigm (2004, pp. 39f.) how language education (or acquisition) policy as part of language management impacts on language practices and beliefs.

In educational settings AP is primarily concerned with access and literacy. The main tasks are choosing the language of instruction (LoI) as well as the range of second/foreign languages to be offered in the curriculum. Such decisions frequently involve economic (Grin & Vaillancourt, 1997) and language ideological considerations that reflect the perceived market value of language(s) (Bourdieu, 1991). Often AP choices form part of the politics of difference, echoing (changing) relations of power in terms of shifts in the use of formerly dominant and native languages. In many cases policy pressures over struggles for mother-tongue rights for indigenous or immigrant students can engender conflicts with ethnonational ideologies. Overall, AP decisions that pursue the dual objectives of facilitating education in the mother tongue of children from marginalized language communities as well as in the officially sanctioned language of a polity have been proven to have

2 ACQUISITION PLANNING

positive effects on the learners' sense of empowerment and educational outcomes (Tsui & Tollefson, 2004). Skutnabb-Kangas (2008) has pointed to the human rights aspect of diversity in education, which will be further dealt with below. Of pedagogical importance for AP considerations is research that points to the cognitive benefits of continued instruction in the mother tongue through bilingual programs (Cummins & Swain, 1986).

We now move our focus to issues arising for AP in countries in sociopolitical transition, taking as our starting point postcolonial settings in Africa, and then consider applications in the post-Soviet context.

Postcolonial Settings

In a postcolonial context AP is inextricably intertwined with the historical development of the linguistic situation, and in particular with the imposed dominance of the language of the former colonial power. At the time of independence in Africa, educational systems were in place in which the colonial languages were almost unchallenged as media of instruction. While French and British policies differed with regard to language use in their colonies (Robinson, 1996), the desire to replace colonial administrators at all levels with local personnel, one of the principal aims of education at the time, meant a concentrated focus on the language by which the administration functioned. A concern at that time for nation building, national (rather than ethnic) identity, and the overhang of the European idea of "one nation, one language" provided the underlying principles for AP. It is thus clear that the basis for planning was not the role and functions of language in facilitating communication, development, or education—planning was driven rather by the perceived political interests of the newly independent nation-state.

This is not to say that there was no concern for the use, development, and cultural value of African languages—some colonial functions (such as agricultural extension), some missionary schools, and some local communities had long advocated and adopted the communicative and educational advantages of using the mother tongue. Achieving functional levels of literacy—whether in formal or nonformal programs, for children or adults—provided strong arguments for an initial use of the mother tongue and the subsequent introduction of other languages. These arguments have regained currency in recent years (UNESCO, 2003) and have reshaped policies on language use, particularly in education. An increasing number of African countries have passed legislation, adopted educational reforms, or even amended the constitution so that African languages are recognized as viable and necessary languages of instruction (Djité, 2008). However, the implementation of such changes and the practice of mother-tongue-based multilingual education (MLE) lags behind, and one reason for this is the lack of planning on how to deal with the implications of the new policies.

Political, social, cultural, and educational reasons predominate as the basis for these policies, and the arguments drawn from all these perspectives are both valid and compelling, finding part of their justification in a rights-based approach to governance and development (Skutnabb-Kangas, 2008). However, this has not been followed by adequate *planning*, particularly in education. As the European Framework, cited below, noted, AP affects more than simply levels and standards; it affects also "the elaboration of language syllabuses, curriculum guidelines, examinations, textbooks . . .," as well as teacher training, school governance, and management of the system.

Nevertheless, whether the approach is based on an understanding of AP or on the need to offer quality education and viable literacy, MLE is gradually gaining ground, with the debate shifting away from whether to adopt MLE to questions of the best models to adopt. The meeting of the Association for the Development of Education in Africa (ADEA) in January 2010 addressed questions of the optimum integration of mother tongues and other

languages (such as official or national languages) over the course of primary and secondary educational cycles (ADEA, 2010). One of the key questions is how far educational considerations—that is, improving the quality of learning outcomes—will predominate in governments’ motivation for planning multilingual education. Ager (2001, p. 195) argued that “ideals of social cohesion, elitism or social mosaicity” are likely to prevail as the state’s motivation for determining language policy, rather than functional concerns or the perspectives of local communities. Attitudes to the functional aspects of language use as well as the relative neglect of local community perspectives can be understood as manifestations of power—its promotion, imposition, or preservation—with the consequent neglect of how language policy may affect learning in particular communities.

A striking example of the opposite situation was documented in the 1990s in the Democratic Republic of Congo (then Zaïre), where, in the relative absence of government influence or control, a nongovernmental initiative modeled adult literacy acquisition on the patterns of actual language use in the community (Robinson and Gfeller, 1997). As described at the time, the program adopted a three-language approach:

- the local language (Ngbaka) as the language of initial literacy learning and medium of instruction throughout the program;
- the regional language (Lingala), already spoken by adults in the region, with literacy skills extended to Lingala;
- the official language (French), of which adults in the program had no prior knowledge. Literacy in French enabled access to vast amounts of development and other literature. Learners typically accessed a French development handbook, but discussed and applied the knowledge they gained in the local language.

While such a multilingual approach appears to some planners as cumbersome, expensive, and unnecessarily complex to implement and manage, it is in fact the most appropriate and fitting way to use languages in learning, from the perspective of the local people. In terms of AP, it demonstrates the principle that the “plurilingual and pluricultural competence” (from the Common European Framework of Reference, CEFR—cited below) advocated for other settings must start, in postcolonial contexts, not with foreign or official languages, but with the language(s) people actually speak. It is, on the one hand, astonishing that such a principle, taken for granted in European contexts, should have to be argued and demonstrated elsewhere, but, on the other hand, it is also predictable, given the frequent manipulation of language as both an instrument and a symbol of power, particularly during the colonial era.

Post-Soviet Settings

In contrast to the context introduced above, language planning in newly independent post-Soviet settings has aimed since the early 1990s at the substitution of the former “colonial” language (Russian) with the legally reinstituted titular (or state) languages in the public sphere: in official administration, communication, media, and signage in townscapes. The main tendency in language management has been to strengthen the position and raise the prestige of the state language in all domains, particularly in education. In order to increase the number of users of the national languages, governments have prioritized a reduction or elimination of teaching in Russian (for details see Pavlenko, 2008, pp. 282ff.). In the new curricula the national language is a compulsory subject by law, and the status of Russian has been changed from that of a second to a foreign language. National language testing measures have been introduced for school leavers, university entrants, and for job seekers in the public service or in local government, where a good command

4 ACQUISITION PLANNING

of the titular language is required. This has entailed publishing redesigned textbooks, facilitating teacher training and free language courses, and providing translation services.

At the same time, and to reverse the previous Russification of other minorities, particular emphasis has been placed on providing elementary education in a number of non-Russian minority languages. This has led to the development of a variety of bilingual, immersion, and minority-language-medium models of schooling. These achievements have occurred in a context of extreme economic hardship, the need to alter radically many aspects of the Soviet heritage, and incessant pressure from Russia and from various international players. Yet, as can be observed elsewhere in the world, many parents in their pragmatic and instrumental orientation encourage their children to study in the majority language (and English) rather than the one spoken at home (see Hogan-Brun, 2010, p. 8). In terms of Russian itself, in some regions (for instance in the northeastern Ida Varumaa region of Estonia, in eastern and southern Ukraine, or in the Moldovian breakaway republic Transnistria) there has been a continuation of a broad Russian linguistic environment with high language maintenance through the system of schooling as well as appropriate media and cultural institutions.

Apart from substituting Russian in the school curricula with the national language as a compulsory subject and introducing the languages of national minorities as academic subjects, the main focus of AP has been to increase study of foreign languages education. The collapse of the Soviet Union and the political drive to join the European Union (EU) in 2004 had entailed rapid changes of the sociopolitical and linguistic reality. The new era was also marked by new types of migration leading to diverging language behaviors across the countries of Central and Eastern Europe. Hence the need arose to learn different foreign languages, with textbooks often in short supply. Increasing westward orientation means that the teaching of English is constantly expanding, and it predominates in most instances. At the same time, as is shown below, challenges in the West have led to new AP developments.

(Western) European Settings

In a culturally and linguistically diversifying Europe, AP approaches have generally started to focus more on supporting multilingualism. Here, the promotion of plurilingual and pluricultural competence increasingly forms part of the remit of AP and is influenced by frameworks (see below). The fostering of individual plurilingualism is now considered a fundamental principle generally, as in education. As language education policies are being adapted to accommodate the multilingual needs, the idea in education of language as a resource (Ruiz, 1984) is being put into practice through multilingual schooling. This can include the promotion of (two-way) immersion programs (Budach, Erfurt, & Kunkel, 2008). In acknowledging the cognitive, social, and cultural advantages of multilingualism, such models support practices that aim to mobilize children's own linguistic and cultural resources in a flexible educational setting.

Prompted by the EU's promotion of multilingualism, foreign language learning at an early age has been introduced in many member states, usually from the primary level onward. It is compulsory to learn two languages at that stage in Estonia, Latvia, Luxemburg, Sweden, Iceland, and Greece (Key Data, 2008). In several countries (Estonia, Italy, Finland, Sweden, and Norway) students are obliged to choose their first (out of two) foreign language in their initial school year. Whilst this trend represents a less marked change in Eastern European member states where children have had to start learning Russian relatively early up to the late 1980s, such reforms there can entail local positionings ranging from an essentially ethnocentric and nationalist to a multilingualist rhetoric. The positive

political and social trade-offs of early foreign language learning, however, are largely undisputed. Among the claimed social advantages of an early start are that introducing young learners to other cultures equips them better for democratic citizenship and for future professional mobility, and that it helps them overcome narrow-mindedness and ethnocentric thinking.

In the final part we present AP in the context of European frameworks and consider didactic implications.

The Common European Framework of Reference for Languages (CEFR)

In Europe, the Council of Europe's publication of the *Common European Framework of Reference for Languages: Learning, Teaching, Assessment* (2001) marks a significant development in AP. This goes back to an agreement made in 1991 that a "Common European Framework" should be established in order to "promote and facilitate cooperation among educational institutions in different countries" and to "provide a sound basis for the mutual recognition of language qualifications" as well as "assisting learners, teachers, course designers, examining bodies and educational administrators to situate and coordinate their efforts" (Council of Europe, 1992, p. 37). The focus in this section is on the current application of, and issues for, AP of the framework (reviewed in Little, 2006), which has been translated into more than 30 languages.

In the area of AP the CEFR has initially mainly been used as an instrument to set and describe standards of language qualifications (Council of Europe, 2005). However, the intended focus was a more comprehensive description of "what learners have to do in order to use a language for communication and what knowledge and skills they have to develop so as to be able to act effectively" (Council of Europe, 2001, p. 1). While the Framework is influencing curriculum planning in Europe and parts of Asia, its impact on language teaching and learning is more difficult to assess. For AP, the core contribution of the framework is its action-oriented approach with a strong emphasis on plurilingual and pluricultural competence, "to which all knowledge and experience of language contributes and in which languages interrelate and interact" (Council of Europe, 2001, p. 4).

Drawing on work by Coste, Moore, and Zarate (1997), the CEFR describes communicative language competence as dynamic and varied, thereby abandoning the idealized monolingual native speaker as a model. This has to be seen in the context of the two main challenges in educational policy making that have arisen within the EU: the pragmatic need to achieve high levels of proficiency in the context of increasing personal and professional cross-border mobility in Europe and, as a consequence, the construction of plurilingual and pluricultural identities that no longer follows the "one nation, one language" paradigm. The introduction of the European Language Portfolio (ELP) is perhaps the most tangible effort to create an instrument that documents learners' plurilingual competences and promotes self-assessment and autonomy in language learning. For current ELP-related documentation see the Council of Europe's ELP-website (www.coe.int/portfolio). The European Centre for Modern Languages, which is part of the Council of Europe, conducts numerous ELP-related projects (www.ecml.at).

The plurilingual approach adopted by the CEFR has generally been welcomed by the research community in language teaching and learning. There has, however, been substantial criticism in areas that concern AP (Byrnes, 2007). Some fear that the application of the CEFR might lead to disproportionate influence of language testing agencies in curriculum design (e.g., Little, 2007) and produce a backwash on teaching practices (Krumm, in Bausch, Christ, & Königs, 2003, pp. 120ff.). Others have pointed out that generic descriptions

of language use and related competences in the CEFR do not take into account the variety of important target groups in language teaching and learning across Europe. The prototypical learner in the framework appears to be adult, with an interest in tourism or professional language use (see the numerous contributions in Bausch et al., 2003). Krumm, in highlighting this issue, states that the “very heterogeneous groups of migrants are, however, totally different from the learners originally targeted by the CEFR” (2007). Other criticisms concern the validity of underlying theories of second language learning and the fact that the plurilingual approach is rarely visible in the descriptors that illustrate aspects of communicative language competence in the framework. Bilingual or plurilingual ways of communicating are not at the center of descriptions of linguistic competences or domains of usage.

The following section discusses two current developments as efforts to put the plurilingual approach into practice. The first is a “platform of resources and references for plurilingual and intercultural education,” set up by the Language Policy Division of the Council of Europe (2009) as an instrument for the purposes of AP in the school context. The second is an effort to create integrated approaches to language teaching and learning in the school context.

Council of Europe: Platform of Resources and References for Plurilingual and Intercultural Education

The platform is introduced on the Web site as a new instrument in AP that enables users to reflect on the complex roles of languages present in educational contexts, possibly as a response to criticisms leveled at the CEFR. The “Common European Framework of Reference for the Languages of Education” is integrated into this new resource, which offers hyperlinked access to the different areas relevant to AP (see Figure 1). This chart illustrates the centrality of language proficiency in all learning contexts, as is reflected in literacy research (Thonhauser, 2008). The hyperlinks lead to collections of documents (e.g., reports, working papers, pilot studies) related to the core themes of the chart. It remains to be seen if this tool, which has been designed to avoid the (perceived) prescriptive nature of frameworks, will replace the CEFR and other frameworks relevant to AP in the work of the Council of Europe.

Mehrsprachigkeitsdidaktik—Didactique intégrée— Integrated Language Learning

The notion of “plurilingual and pluricultural competence” has led to new didactic approaches. Francophone research uses the term “didactique du plurilinguisme,” stressing the socio-political aspect of plurilingual education as a right (Moore & Gajo, 2009) and focusing mainly on immersion programs. In the German-speaking community research has mainly been on Third Language Acquisition (Hufeisen & Marx, 2004), and “Mehrsprachigkeitsdidaktik” focuses on developing integrated curricula in the area of language learning (Hufeisen & Lutjeharms, 2005). Jessner (2008) presents an overview of different theoretical approaches to plurilingualism and relates these to issues of AP.

In Switzerland, integrated approaches to language learning form part of official AP policies, as highlighted in a key document of the Swiss Conference of Cantonal Ministers of Education (CDIP, 2004, chap. 4.7). Efforts are under way to implement this in various educational contexts nationally. As pointed out above, the promotion of content and language integrated learning (CLIL) constitutes one of the main strategies in AP on a European level (see European Commission Web site: http://ec.europa.eu/education/languages/language-teaching/doc236_en.htm).

Final Remarks

As this entry suggests, the main issues currently pertaining to AP are: access to literacy and achieving functional levels of literacy (in postcolonial settings); (the facilitation of) mother-tongue-based multilingual education; a focus in planning on the role and functions of language in facilitating communication; adequate planning that goes beyond levels and standards; promotion of plurilingual and pluricultural competence through multilingual schooling in a flexible educational setting; fostering self-assessment and autonomy in language learning; creating integrated approaches to language teaching and learning in the school context.

Concerns at the macrolevel are: a lack of vitality in minority language learning; conflicts between the political and social arenas as a result of shifting ideologies as attempts are made in transitional settings to put policy into practice; the negotiation of language use at the micro level; diverging educational policies and practices to cater for the needs of pluralist societies. Further research is needed to provide knowledge in these areas of application.

Adverbs

LEO FRANCIS HOYE

Adverbs are the “bête noire” of English grammar. Their use attracts praise or censure in equal measure. Henry James remarked: “I’m glad you like adverbs—I adore them; they are the only qualifications I really much respect” (James, 1920, pp. 214–15), a view not shared by the writer Stephen King: “I believe the road to hell is paved with adverbs” (King, 2000, p. 95). While mostly optional in a grammatical sense, adverbs can add meaning to other clause elements, such as adjectives, other adverbs, nouns, verbs, even entire clauses. Concluding an interview with the wife of a suspect, a detective instructs: “‘Perhaps you would notify us, if he returns?’ ‘Oh *definitely*; *surely*, *absolutely*, *no doubt* about it’” (Furst, 2010, p. 23). Cull the adverbs (italicized) and the exchange sounds lame: “‘You would notify us, if he returns?’ ‘Oh yes.’” The oblique command and the unease it engenders are now gone. Adverbs can be persuasive: *The political system is historically good at promoting social over private interests—not immediately, not perfectly, not always, but generally.* And sometimes ironical: “Yes Mr. [French President] we [the UK] *absolutely, categorically, possibly, maybe*, could be going into Europe” (Hoye, 1997, p. 236, 2009, p. 112). Positionally mobile and semantically versatile, adverbs cover a range of meanings and grammatical functions, and several may co-occur. They can be used at best to marked effect; at worst, to create a verbal swamp. Their sheer diversity of use and function has earned them a maverick status as “the most nebulous and puzzling of the traditional word classes” (Quirk, Greenbaum, Leech, & Svartvik, 1985, p. 438). Adverbs are heterogeneous: Their miscellany of assorted features has bolstered the argument that, where a word cannot be assigned to another word class (such as noun, verb, adjective), it must be an adverb by default, rendering this a “catch-all” or “residual” category (Huddleston & Pullum, 2002, p. 563). Such heterogeneity makes for considerable semantic and syntactic diversity—something of a linguistic smorgasbord! In profiling their main features, this entry seeks to highlight the role and significance of adverbs for our everyday spoken or written communication. The examples that follow are given in italics, and the adverb(ial) forms are underlined. Frequent reference is made to three state-of-the-art grammars of contemporary English: Quirk et al. (1985); Biber, Johansson, Leech, Conrad, and Finegan (1999), and Huddleston and Pullum (2002).

Form, Function, and Classification

Form-wise, adverbs are morphologically more complex than the other word classes. Of the three constituent categories, two are closed-class: simple adverbs (*back*; *just*; *well*; *up*; *through*) and compound adverbs (*therefore* [*there* + *fore*]; *somehow* [*some* + *how*]; *nowhere* [*no* + *where*]). Closed classes are fixed or finite and rarely admit new members. The third category, derivational adverbs, is open-class: New adverbs can always be added. Many end in that most productive adverbial suffix *-ly*, which can be glossed ‘in an adjective manner/way’ (*They should be able to express their views frankly without feeling intimidated* > *They should be able to express their views in a frank manner*; *Each movement must be carefully structured* > *Each movement must be structured in a careful way*) or ‘to an adjective degree/

2 ADVERBS

extent' (*Telephone charges at hotels differ considerably > Telephone charges at hotels differ to a considerable extent*). But there is no regular or necessary correspondence of meaning between adjectives and their *-ly* adverb derivatives: *All references will be included in the present chapter* versus *The travel industry is presently experiencing a downturn*; *In most gardens a dining area is an absolute must* versus *The event had absolutely no impact on me*. (See further in Huddleston & Pullum, 2002, p. 566; Crystal, 2004, p. 269.)

Adverbs ending in *-ly* sometimes co-occur in complementary opposition: *You can have one life publically and another life privately*; *Too carefully led or too carelessly ignored?*; *The good ended happily, and the bad unhappily*. Just occasionally *-ly* attaches to a noun, as in this recipe title for beef tripe: *Offaly-Delicious!*; or to a phrase: *He said it matter-of-factly, as if it happened all the time*. Adjectives and adverbs (in that order) may act in concert to give emphasis: *X wants to live his private life privately*; *It's about absolute performance absolutely*. As regards usage, adverbial neologisms sometimes attract criticism for stylistic reasons, as in the blending of the adjectives *huge* and *tremendous*: *The breathtaking and humongously big dancehall*. Alternatively, a simple adjective may be a better choice than (overblown) adjectival-adverbial modification: *The cavernous dancehall*. Use of *hopefully* as a sentence modifier (e.g., *Hopefully, the language police are no longer opinion-formers*) continues to exercise its angst-ridden detractors: "I'm afraid 'hopefully' is here to stay, like pollution and sex and death and taxes"! Yet no voices disparage *certainly* or *surely* so used (Merriam-Webster, 1994, pp. 512–13). Advertising copy regularly exploits the creative potential of adverbs: *One "Paws-itively" Posh Pup* (ad for dog figurine). Dickens could not resist their partnership in collocational deviance: *happily hanged*; *nomadically drunk*; *exasperatingly comfortable* (Hori, 2002, pp. 158, 155, 159). Manner adverbs are a prime powerhouse of figurative wordplay. Note that the *-ly* suffix does not always signal adverbial status; a number of adjectives also end in *-ly*: *the early bird*; *a friendly greeting*; *a likely story*; *the ugly duckling*. Less common are those adverbs with endings such as: *-wise > crabwise, counterclockwise, edgewise*; *-wards > backwards, upwards, westwards*; *-fashion > philosophical-fashion, schoolgirl-fashion*. (See further in Quirk, et al. 1985, pp. 438–9; Huddleston & Pullum, 2002, pp. 565–70.)

Adverbs are commonly described as the head of "adverb phrases," either standing on their own or modified by one or more dependents, themselves adverbs: *Recently, the area has been redeveloped*; *Very recently . . .*; *Only very recently . . .* Traditional terminology misleadingly implies that adverbs are primarily verb modifiers, specifying the mode of action of the verb. Adverbs act in a variety of ways: to modify other elements in the clause structure, such as adjectives (*incredibly beautiful*); other adverbs (*quite seriously*); occasionally nouns (*rather an interesting project*; *the very point I'm making*); verbs (*They have completely lost their way*); or, often, the clause as a whole (*Fortunately, they didn't come*; *They will probably survive*; *The talk was quite interesting really*). They thus differ in their scope and in terms of the clause element(s) they modify.

Syntactically, adverbs can be related to such questions as "where?" (*here*; *there*; *somewhere*; *nowhere*); "when?" (*now*; *tomorrow*; *soon*); "how often?" (*frequently*; *never*; *twice*); "how?" (*well*; *slowly*; *brilliantly*; *carefully*); "to what extent?" (*quite*; *rather*; *fairly*), and so on (Crystal, 2008, p. 14). By relating adverbs to these types of question, their functional correspondence to multiword units, called "adverbials," soon becomes apparent. The query "When are they off?" might elicit: *now* / *tomorrow* (adverb phrase, with an unmodified adverb as its head); *pretty soon* (adverb phrase, with the adverb *soon* as its head, modified by an adverb intensifier); *in a few days' time* (prepositional phrase, with the preposition *in* as its head); *when I see fit* (finite clause). An adverbial is thus a syntactic unit, distinct from other clause elements—subject, verb, object, and complement. It is the next most frequent constituent after subject and verb (Quirk et al., 1985, p. 478n), and as Quirk et al. remark: "The vast majority of clauses . . . contain at least one adverbial" (1985, p. 478n). When contrived data

are used in sentence grammar or English-language learning and teaching materials, this point is often ignored; adverbs are regularly omitted unless chosen for the purpose of commentary (Crystal, 1980, pp. 160–5).

Adverbs are the most mobile of all clause constituents. They enjoy greater freedom than their structurally more complex multiword counterparts, which generally favor end position. They can appear initially (**I**), medially (**M**: within the clause, in a variety of positions), and finally (**E**), without this affecting the grammatical integrity of the clause: *Possibly they may have been sent to Bucharest* (**I**); *They possibly may ...*; *They may possibly ...*; *They may have possibly ...*; *They may have been possibly ...*; *They may have been sent possibly ...* (**M**); *They may have been sent to Bucharest possibly* (**E**) (see Quirk et al., 1985, pp. 490–501; Huddleston & Pullum, 2002, pp. 575–8; Crystal, 2004, p. 274). Generally speaking, adverbs at **I** or **E** are peripheral to clause structure—their orientation and scope affects the clause as a whole. Those at **M** tend to be more integrated and restricted in compass, where they highlight the adjacent verb (or verb phrase). Ultimately, adverb(ial) placement is often a matter of focus and stylistic choice. As Huddleston and Pullum (2002, p. 576) remark: “There is a great deal of variation in [adverb] use, and features of context, style, prosody, and euphony play a role in some decisions [on placement and focus].”

Adverbs are usually categorized on the basis of their position and function within the clause. More than any other word class, they demonstrate the interdependency between grammar and meaning, although accounts differ markedly in their classification schemes and terminology. This may lead to terminological confusion (see Hasselgård, 2010, pp. 14–39). Quirk et al. (1985, pp. 438–653) and Crystal (2004, pp. 268–93), in his synopsis thereof, distinguish four classes of adverb divided into two main groups: adjuncts and subjuncts; disjuncts and conjuncts. Adjuncts relate to the verb or “verb phrase” (*She spoke quickly and earnestly with her boss*), or to the clause as a whole (*Nowadays, I take the bus*). They constitute the largest subgroup of adverbs, and include such traditional categories as adverbs of place, manner, and time, sometimes known collectively as “circumstantial adverbs” (Biber et al., 1999). Occasionally, adjuncts may be obligatory (i.e., they are required by the verb to make the clause grammatically acceptable): *Ruth lives in Berlin*; *The speech went all right*; *The bridge was built last year* (Hasselgård, 2010, pp. 46–8; Goldberg & Ackerman, 2001). Subjuncts generally play a more subordinate role in relation either to the clause or to a clause element, especially the verb or verb phrase, here to heightening effect: *I couldn’t, literally, couldn’t, understand what he was saying*. Subjuncts comprise adverbs expressing: viewpoint (*Economically and politically [speaking], they’ve been completely disenfranchised*), focus (*Only the lonely know the way I feel tonight*), degree (*You obviously, absolutely must watch this*), and courtesy, where their role is essentially formulaic (*Please/Kindly refrain from saying that in public*). In short, subjuncts add the speaker’s slant toward the content of the associated clause (Crystal, 2004, pp. 284–5). Disjuncts have a superior role in relation to the clause, by making a judgment, a comment, or an evaluation about what is being said: *I think it’s probably different for different people*; *Fortunately, however, there are plenty of cheaper options*; *As for this book, it is regrettably much too long and expensive*. Conjuncts are peripheral to clause structure and have a linking or relational function between clauses when these are viewed as connected discourse: *They gave me the job so they must like me*; *Environment can never completely explain art. I am sure, however, that it plays an important role*; *We have a way of talking, and thus a way of thinking*. In combination with modal verbs, certain types of subjunct and disjunct are significant for the expression of modality: *It may well be difficult to keep you on*; *You really should go along for the ride*; *I think perhaps they could leave now*; *Of course, it may be much older in origin*. (See further Høye, 1997; see also Simon-Vandenbergen & Aijmer, 2007, pp. 68–9, and Aijmer, 2009, pp. 111–30, on the issue of modal adverbs and modal particles.)

Semantic Roles

Since adverbs express such a wide range of meanings, treatment of their grammar also involves focusing on their semantic roles. Quirk et al. (1985, pp. 479–86) distinguish seven broad categories, often based on a figurative extension of what they call “spatial relations.” Space or “place” adverbs refer to position (*Come here*), direction (*They’re heading eastwards*), distance (*They’re far from home*); time adverbs to temporal distance (*It might have happened yesterday/before/then*), duration (*The meeting went on forever*), frequency (*The alarms need to be tested regularly*), relationship or “temporal continuity” (*Work is already/still in progress* [work has started/is ongoing]); process adverbs refer to manner (*He was casually dismissed from the job*), means (*They should be supported medically*), instrument (*The air pressure should be measured barometrically*), agent (*The device can be connected wirelessly*); respect adverbs convey the sense “in regard to” (*He’s being advised legally* [on points of law]); contingency adverbials refer to cause (*She cried from laughter*), reason (*He really married her for money*), purpose (*They stood together in order to be identified*), result (*As a result of careful preparation, the project is on time*), condition (*The military will disclose casualties only if asked*), concession (*Despite a substantial reward, the loot was never recovered*)—where there is no single-word or simple adverb equivalent to the multiword adverbial units or expressions cited; modality adverbs refer to emphasis (*I was absolutely amazed by the results*), approximation (*They were probably working late*), restriction or “focus” (*They alone have the authority*); degree adverbs refer to intensity (*I really don’t know what to say* [I haven’t got a clue]; *I could barely understand them*). Sometimes medially placed adverbs overlap between two not unrelated readings, here modality (emphasis) and manner: *The government is resolutely opposed to such a solution*; “it is very much opposed and opposed unhesitatingly/in an unhesitant way.” The intensive meaning predominates—through a process called “delexicalisation” (Hoye, 1997, *passim*)—while the more lexically loaded, manner reading becomes secondary. Adverb classes are not watertight; their interpretation often depends on recognizing the wider context although, even then, there may be a blending of possible interpretations. In *Look at it medically*, the adverb may indicate manner (“in a medical way”), means (“by invoking medical techniques”), or instrument (“by applying principles of medical ethics”).

Conclusion: Adverbs in Discourse

Adverbs are more than mere embellishment; they underpin processes of textual argumentation and provide additional, circumstantial information that helps avoid any sense of anomaly, or incompleteness about what is being said (Goldberg & Ackerman, 2001, p. 798). Pervasive in discourse, adverbs occur across all genres, regardless of levels of formality or medium. Crystal (2004, pp. 279–81, 291–3) identifies very broad correspondences between text types and adverb use in historical, geographical, scientific, and instructional writing; and in courtroom language, sports commentary, and public speaking. For instance, historical writing is characterized by the use of temporal and space (place) adverbs (events have a time and a place); instructions by process adverbs (how and with what is “x” to be done). In their extensive quantitative analysis of adverbial behavior, Biber et al. (1999) explore four registers: conversation, fiction, news, and academic writing. Hasselgård (2010, pp. 7–10, 259–85) additionally covers sports commentary and social letters. Both conclude that, overall, adverbs (adjuncts) are more common in commentary and fiction. However, generalizations are not easy. As Crystal (2004, p. 279) remarks: “[Adverbial] choice and distribution will be influenced primarily by the subject-matter of the discourse.” In speech, it is also true that, once uttered, an adverb . . . may trigger a veritable onslaught: “Yes, but even though they probably certainly know that you probably wouldn’t [use it], they don’t certainly know that, although you probably wouldn’t, there’s no probability that you certainly would!” (Hoye, 2005, p. 1498).

Advocacy in Language Teaching

FABIOLA P. EHLERS-ZAVALA

Advocacy in language teaching refers to the act of positively advancing the public and political realities connected to issues in language and language teaching. An advocate in language teaching is someone who espouses and argues for one or more issues in language teaching hoping to positively influence its outcome for the common good. When it is enacted by those who are directly involved with the language teaching profession (e.g., applied linguists, language teacher educators, classroom teachers), such actions represent instances of participatory professionalism.

As Abbott (2009) explains, advocacy work related to language teaching can be carried out at various levels. At the local level, advocacy is put into practice by those who undertake a wide range of actions, from counseling/encouraging students to study languages to organizing college or school-wide programs. At the state level, advocacy may be practiced by those who attempt to influence legislation on language education. At the national level, in the United States, many advocates of language teaching and education may choose to get involved with other organizations that are attempting to advocate on behalf of language teaching and education. Examples of these include the Joint National Committee for Languages (JNCL) and the National Council for Languages and International Studies (NCLIS). At the international level, other organizations such as UNESCO and the Association Internationale de Linguistique Appliquée or International Association of Applied Linguistics also serve as platforms that provide support to the work of advocates in language teaching through the research efforts they make publicly available.

In an era of accountability and scientific-based evidence, an effective advocate is well versed in the current research, and (as relevant to the advocacy effort) in the local, state, national, and international issues affecting language education, policy, and practice. Professionals who choose to become public intellectuals and engage in advocacy make use of a variety of advocacy techniques and strategies to raise awareness of the issues. Thus, effective advocacy in language teaching requires that professionals undertaking this challenge possess a set of specific skills, techniques, and knowledge regarding the issues for which they will advocate, or serve as advocates. An effective advocate is an “articulate spokesperson” who knows how to “speak up for language education” (Abbott, 2009) in a variety of situations. For instance, an advocate may engage in (a) making phone calls; (b) writing persuasive letters or press releases; (c) contributing to, or drafting, position statements that can be adopted by professional organizations in which the advocate holds membership; (d) meeting with stakeholders and key individuals who are in positions of power and have the ability to influence the outcome of an issue pertaining to language/ language teaching that is being debated (e.g., colleagues, community members, legislative bodies such as City Councils, State Assemblies, or Congress); (e) giving expert testimony on policy issues in a public forum or at a hearing in front of the legislature; and (f) engaging in outreach activity to build coalitions with other groups or organizations that espouse similar goals, and are advocating on similar topics. Effective advocates are, or actively seek to become, well versed on how to carry out all of these rhetorical/political actions effectively.

2 ADVOCACY IN LANGUAGE TEACHING

Brand (1996) explains that “to advocate a position is, at the minimum, to state that it is correct and most often additionally to present a defense of the position through the presentation of arguments” (p. 7). He clearly states that when professionals engage in this activity, they are also making a normative judgment by virtue of adopting a side on the issue which they are advocating. Brand, who believes that advocacy is part of the teaching profession, states that advocacy can unfold in the classroom situation in one of two ways: intentionally or unintentionally. He also says that, if it is to happen in the classroom, the former ought to be the preferred mode.

Further, Brand (1996) states that there is a fine line between *advocacy* and *proselytizing*. He argues that this difference matters considerably in professional obligations. The former is carried out in context. The latter is not. Brand explains that the act of advocacy requires that professionals present a balanced approach to the issues as these are situated in the professional dialogic debate at large. As he emphasizes, the act of proselytizing is instead coercive in nature, and does not provide an account of other possible alternatives.

The act of advocacy in the classroom may be further intrinsically challenged in, at least, three aspects (Voll, 1996). First, it may be difficult to distinguish between a mere effective explanation and an act of advocacy undertaken by a professional in front of a class. Second, it may be inherently difficult not to portray an adversary as a “repugnant cultural other” (p. 174). Third, some professionals may be particularly challenged on the bases of their own disciplines. Bérubé (1996) observes that “some forms of advocacy are not merely permitted but positively mandated by certain fields of study” (p. 193). In other words, some disciplines may “represent a form of advocacy.” Clearly, this could be easily the case for those involved in any of the social sciences and specifically in applied linguistics. Indeed, one could claim that “advocacy” is integral to applied linguistics and language teacher education, and failure to recognize this could be taken to represent failure to see the social ramifications of one’s work. It is therefore encouraging that accreditation standards for teacher education put forward by the National Council for Accreditation of Teacher Education (NCATE), the American Council on the Teaching of Foreign Languages (ACTFL), the National Board for Professional Teaching Standards (NBPTS), and Teachers of English to Speakers of Other Languages (TESOL) require that institutions of higher education ensure that candidates “demonstrate that they possess the knowledge and skills to be effective advocates for language programs” (Abbott, 2009, p. 1).

Professionals interested in advocacy are likely to join, initiate or both join and initiate advocacy groups. Sometimes, these advocacy groups may form within already established professional organizations. For instance, TESOL has a public link in its website titled: US Advocacy Action Center available on-line to TESOL’s members and non-members, offers “detailed information on the US Congress including a congressional directory, legislation and bills, and communication tools.” Some other times, advocacy groups are newly formed as a result of the need to search for a more focused and direct effort on effective advocacy work, as is the case of the Institute for Language and Education Policy (www.elladvocates.org). Long-standing centers, such as The Center for Applied Linguistics (www.cal.org), also offer a wealth of resources and links to other organizations and centers that engage in advocacy.

Likewise, a number of universities across the United States support advocacy efforts, for example, at Penn State, the Center for Advancement of Language Proficiency Education and Research (<http://calper.la.psu.edu/resources.php?page=langadv>). At the University of Hawaii, the Language Documentation Training Center (<http://www.ling.hawaii.edu/~uhdoc/index.html>) assists native speakers of languages that have been historically under-documented learn to document them.

Colorado State University’s graduate student association for Teaching English as a Second/Foreign Language (TESL/TEFL GSA) organizes TESL/TEFL Advocacy Week each Spring Semester, bringing to campus a leading expert in applied linguistics for a campus

lecture, in addition to conducting a number of advocacy-related activities on and off campus. Pennsylvania's Juniata College (<http://www.juniata.edu/departments/international/lim/index.html>) offers "innovative, cooperative, outreach program using study-abroad returnees, international students, and upper-level language students to aid local, rural, K-12 teachers by creating and presenting language and cultural activities in their classrooms."

In higher education, courses in applied linguistics, language teacher preparation, or both are logical places where advocacy can unfold and where learners can be provided with access to research and opportunities to acquire the skills needed to engage in sound advocacy. In an era where service learning is becoming fundamental to the overall educational experience, language teacher education candidates in particular could have an opportunity to gain field-based experiences as they interact with community based-organizations in fulfillment of their service-learning assignments for their courses.

However, as with advocacy in the classroom in a broader and more general sense, the topic of advocacy is still subject to some professional debate. The debate centers around issues of whether or not advocacy (a) has/should have a role in the classroom; (b) is an exercise in academic freedom and, therefore, intrinsic to the academic endeavor; and (c) per se is consistent with, or clashes with, the concept of academic responsibility. One may reasonably predict that such debate is likely to weaken in years to come as an increasing number of professionals continue to adhere to postmodern/poststructural/post-poststructural ideologies, characterized by epistemological skepticism and social transformation goals. Under this ideological orientation, advocacy is practically inescapable, and practiced (consciously or not) by everyone. Thus, the more critical questions that would merit scrutiny would relate to the mode, degrees, and content of advocacy as practiced by individual professionals in individual classrooms or within the profession and society at large or both.

Affect and Language Teaching

JEAN-MARC DEWAELE

Affect is at the heart of the foreign language (FL) learning and teaching process and yet, as Garrett and Young (2009) point out: “affect and emotion are terms that have been in the shadows of discussions of classroom foreign language learning, where the primary focus has been on the development of knowledge and use of the new language” (p. 209). The crucial role of the teacher is to nurture positive affect within the group of learners (Arnold, 1999). This implies a use of teaching techniques to encourage the development of learners’ positive attitudes toward the FL and the FL culture, to strengthen their self-belief in their capacity to learn an FL, to increase their motivation to become capable users of the FL, and to control their foreign language anxiety (FLA). Numerous researchers have reflected on the best ways to achieve these goals. I will present a short overview of ways to achieve the goals, and I will reflect on the underlying theories.

Dörnyei and Murphey (2003) reflected on the initial emotions that learners experience during their first class. Initially many of the emotions relate less to the language or the teacher than to the other members of the group: “it is comparable to walking into a party when you hardly know anyone there” (p. 14). Learners are on their guard, unsure of what to expect, observing each other, avoiding embarrassment, wondering what hierarchy will be established within the new group. Learners may have concerns also about their ability to do well in the class, and worry about the fact that the others may be more competent and proficient than themselves. In this stressful first class learners experience general anxiety, social anxiety, and FLA. All this can be coupled to a lack of confidence, a restricted identity, and a certain awkwardness (p. 15). Of course, there are also budding positive emotions such as the expectation and anticipation of learning something new.

The ambiguous emotions that learners experience during the first class have been documented in different studies using different methodological approaches. Garrett and Young (2009) present an analysis of the testimony of the first author, who reported on her own learning process during a Portuguese course for beginners to the second author, in order to understand her “affective responses to the language learning process, the events from which her affect sprang, and her affective trajectory over the 8 weeks” (p. 209). Garrett’s affective responses to events were categorized into four groups: (a) her awareness of her own knowledge of Portuguese, (b) her own professional teacher’s voice, (c) her responses to the Brazilian culture to which she was exposed, and (d) social relations with other students and teacher (pp. 212–13). Quantitative analysis revealed that Garrett’s remarks centered on social relations, followed by her teacher’s voice, linguistic aspects of Portuguese, and cultural information. Only the comments on cultural aspects were overwhelmingly positive; the comments in the other categories were more evenly divided (p. 213). One striking finding is how dynamic emotion is and how variable across categories. Interest in the structure of Portuguese language quickly declined after the start of the course, while interest in cultural instruction increased because it allowed her to communicate with more advanced speakers (p. 222). Social relationships with fellow students played a crucial role: Garrett formed a group of “cool women” and reported an improvement in her feeling of general well-being. Her low perceived proficiency did hurt her self-image and she struggled with FLA until the end of the course. Her attitudes toward

the teaching assistant evolved dramatically over the course: at first she hated his code switching but later on she started to appreciate it more and more. The study shows how the emotional climate in which the learning happens is determined partly by the learner's own emotions, expectations, and effort, and partly by the teaching and support staff.

The early work on emotional matters in SLA focused more exclusively on attitudes and motivation (Gardner & Lambert, 1972). Gardner and Lambert argued that motivation is at the core of SLA. Indeed, a truly motivated student shows a desire to learn the language, is prepared to make an effort in learning, and enjoys the task (Gardner, 1985). Gardner and Lambert (1972) were among the first to point out that learners' levels of motivation are linked to social factors; they originate in and are influenced and maintained by attitudes toward the learning situation and integrative orientation, such as "reflecting a sincere and personal interest in the people and culture represented by the other group" (p. 132). Learners' motivation can also be supported by instrumentality, such as "conditions where the language is being studied for practical or utilitarian purposes" (p. 249). Further research suggested that FL learners with higher levels of integrativeness tend to do better than peers with lower levels (Gardner, 1985). Learners who score high on instrumental motivation also tend to perform well in the FL (Gardner, 1985). The dichotomous view of instrumental and integrative motivation has been criticized in later SLA research. The definition of the integrative concept has also elicited vigorous debates, with some SLA researchers defending a strong version of the concept, namely social identification and integration, while others defended a weaker version, namely a sense of affiliation and interest in the L2 community.

Crookes and Schmidt (1991) presented an alternative, more education-oriented approach to motivation. They argued that motivation could be defined as the choices that learners make in the FL classroom, including experiences, goals, and effort exerted. Crookes and Schmidt distinguished four dimensions: interest, which refers to the student's desire to know (intrinsic motivation); relevance, which reflects the connection between the learner's goals, needs, and values and the course instruction; expectancy, which refers to perceived likelihood of success; and satisfaction, which combines extrinsic aspects such as praise and grades and intrinsic aspects such as pride and fulfillment.

Dörnyei (1994) presented another development of Gardner and Lambert's research. He proposed a more process-oriented approach, focusing more on the social context, and more specifically on the learning situation. He distinguished between different levels of motivational processes, some of which are linked to the enduring social context and quite stable (e.g., the integrative motive) while others are more localized and dynamic, such as the motivation to engage in effortful, task-related behavior within a situation. Learners' motivation will also be influenced by a range of individual psychological and sociobiographical factors in interaction with the wider social, historical, political, and cultural environment (Dörnyei, 2005).

More recently, Dörnyei has suggested abandoning Gardner's concept of "integrativeness" and focusing more on the identification aspects and on the learner's self-concept (Dörnyei, 2005). The "Ideal L2 Self" is the representation of all the attributes that an L2 learner would like to possess, namely becoming proficient in the L2, which Dörnyei interprets as having an "integrative" disposition. Dörnyei (2005) also postulates a second dimension, the "Ought-to L2 Self," namely the attributes that one believes one ought to possess. L2 motivation can then be defined as the desire to reduce the perceived discrepancies between the learner's actual self and his or her ideal or ought-to L2 self. The third dimension is labeled "L2 Learning Experience," which concerns situation-specific motives related to the immediate learning environment and experience.

One negative emotion that has attracted a lot of attention in SLA research is foreign language classroom anxiety (FLCA). Horwitz, Horwitz, and Cope (1986) have defined it as

“a distinct complex of self-perceptions, beliefs, feelings and behaviors related to classroom learning arising from the uniqueness of the language learning process” (p. 128). FLCA is linked to any activity in the FL, but it is typically highest for speaking the FL. It affects learners at all levels and even non-native FL teachers. FL teachers need to be able to recognize explicit anxiety-indicating cues, so as to identify learners who struggle with high levels of FLCA (Gregersen, 2007). This is not an easy task, as some learners are silent because they are frozen with FLCA while others might be shy, introvert, tired, sad, sulking, or simply bored with the topic (Horwitz et al., 1986). Tackling FLCA is very important because it can interfere with learning and performance (Horwitz, 2001). High levels of FLCA in the classroom discourage students from continuing their language study (Dewaele & Thirtle, 2009). However, some researchers have argued that FLCA should not be seen as something entirely negative. Marcos-Llinas and Juan Garau (2009) argue that FLCA can also facilitate FL learning and lead to higher levels of FL achievement. One consistent finding in research on FLCA is the high degree of interindividual variation. This has fostered further research into the possible psychological and sociobiographical antecedents of FLCA. One such study, by Dewaele, Petrides, and Furnham (2008), investigated individual differences in FLA in the various languages of adult multilinguals. Levels of FLA were found to be negatively correlated with levels of the trait Emotional Intelligence. This finding could be related to the fact that speakers with higher levels of the trait Emotional Intelligence are better able to gauge the emotional state of their interlocutor and feel more confident (and hence less anxious) about their ability to communicate effectively. Participants who started learning FLs at a younger age also suffered less from FLA. Participants who had learned a language solely through classroom instruction suffered from higher levels of FLA than those who had also used their language outside the classroom. The knowledge of more languages, a higher frequency of use of a target language, a stronger socialization in that language, the use of that language with a larger network of interlocutors, and a higher level of self-perceived proficiency in a language were also linked to lower levels of FLA (Dewaele et al., 2008).

Other studies have revealed that FLCA and FLA among FL learners and users are linked, to varying degrees, to a variety of higher- and lower-order personality traits, affective factors (attitudes toward the target language, attitudes toward the language teacher), and a range of sociobiographical factors (the knowledge of multiple languages, gender, and age) (e.g., Dewaele, 2007).

So far, I have focused on language learning and mentioned in passing that teachers play a key role in this process. In this final section, I will expand on language teaching.

The teacher's role is to break the ice, to create a “safe” environment where learners are not afraid to speak up and gradually feel they contribute to a collective identity. To attain this, teachers need to make sure they are comprehensible and can convince the learners of the value of learning a language (Arnold & Fonseca, 2007). One way to establish such an atmosphere in the first class is by asking students to briefly interview and then present their neighbor to the rest of the class in the target language. The resulting low hum of conversations and note-taking relaxes the initial tension, and the subsequent short presentations always bring a wealth of rich personal facts, allowing the members of the group to establish their identity and obtain their place within the group. The teacher can joke, gently correct some error, provide a synonym or a translation where needed, and establish links between students with similar interests or languages. In short, this icebreaker allows the teacher to establish a positive emotional environment during the first half-hour of class, and it serves as the basis for all subsequent activities in that class. Indeed, by sharing personal information and jokes, a common identity is created, and by referring back to this shared experience in later classes, the “legend” of the group is created. Research confirms that teachers who manage to create a supportive and friendly classroom environ-

ment, use non-threatening techniques and humor, employ pertinent and appealing subject matter immediately linked to the learners' concerns, and support and promote group solidarity while "having fun" can reduce communicative anxiety in the classroom (e.g., Ewald, 2007) and establish a good "rapport." This rapport is one of the important elements of learner motivation, namely "affiliative drive," that is, the desire to please the teacher (Dörnyei, 1994). Borg (2006) found that one crucial trait of effective language teachers was "an ability to communicate freely and to radiate positive feeling" (p. 23) and to develop close relationships with students.

In sum, emotion and affect are the prime forces that drive the language learning process. FL teachers need to do as much as possible to nurture a positive and stimulating classroom environment, where learners feel that even though the way ahead is long, progress beckons, with a smiling, fluent, ideal L2 self at the end of the road.

African Union

NKONKO M. KAMWANGAMALU

Introduction

The year 2010 marked a milestone for the majority of African nations, as most of them celebrated the 50th anniversary of political independence and liberation from former Western colonial powers. However, as Fishman (1996, p. 5) remarks, “although the lowering of one flag and the raising of another may indicate the end of colonial status, these acts do not necessarily indicate the end of imperialist privilege in neo-colonial disguise.” In Africa, imperialist privilege is on display especially through former colonial languages such as English, French, Portuguese, and Spanish, for they remain the chief if not exclusive medium through which African nations conduct official business in virtually all the institutions of the state, including the government and administration, the educational system, and the media. In this regard, Popham (1996) notes forcefully that while the engine of colonialism long ago ran out of steam, the momentum of its languages remains formidable, and it is against their tyranny that smaller languages fight to survive. Colonialism, says London (2003), is a state of mind in colonizer and colonized alike. It does not end when the colonists go home. Instead, it remains an unfinished business and a footprint, impacting as it does all aspects of a postcolonial polity’s life, including language policy. This entry reviews the language policy statements that the African continent has made, through its institutions such as the African Union, to change the status quo and carve a place for indigenous African languages, especially in the educational system. This is done against the background of the ideologies that have informed language policies in Africa from the colonial era to the present, especially the ideology of development on the one hand, and the ideology of decolonization on the other. It argues that Africa’s language policy statements remain symbolic at best, and that their only merit lies in the fact that they have helped to keep the debate on language policy in Africa alive. It argues further that language policy makers need to do more than merely make policy statements if Africa’s indigenous languages are to break through and become free from the shackles of neo-colonialism and former colonial languages. The entry concludes with suggestions as to how the breakthrough can be achieved, drawing on previous work on the role of African languages vis-à-vis former colonial languages in the educational system (Kamwangamalu, 1997, 2004).

Colonialism, Postcolonialism, and Language Policy and Ideologies

The literature indicates that no Western country utilizes a language for education and other national purposes which is of external origin and the mother tongue of none, or at most few, of its people (Spencer, 1985, p. 390). In Africa, however, children receive an education through the medium of an ex-colonial language such as French, English, Spanish, or Portuguese. Although these languages have been used in Africa for almost 400 years, efforts to promote literacy in and make them accessible to the African masses have failed.

2 AFRICAN UNION

The statistics show that, in 1990, there were 138.8 million illiterate persons in sub-Saharan Africa (UNESCO, 1995). In other words, the social distribution of ex-colonial languages in Africa remains very limited and restricted to a minority elite group, the majority of Africa's population remains on the fringe, language-based division has increased, and economic development has not reached the majority (Alexander, 1997, p. 88). Against this background, Prah (1995, p. 67) notes pointedly that most African states constitutionally create space for African languages but hardly attempt to alter what was handed down through the colonial experience. And since ex-colonial languages are not equally accessible to all, they do not equalize opportunities but rather reproduce inequality. African countries have, for the past 50 years, been grappling with the question of how to remedy this state of affairs and promote the indigenous African languages as the medium of instruction in the educational system. The debate around the medium of instruction is being rekindled by the widening gaps between the elite, who overtly profess the promotion of indigenous languages as medium of instruction while at the same time sending their own offspring to schools where the medium of instruction is a former colonial language, and the masses, who are marginalized because they have no access to ex-colonial languages. Also, this debate is informed by two competing language ideologies: the ideology of development and the ideology of decolonization.

The ideology of decolonization of education requires that ex-colonial languages be replaced with the indigenous African languages as media of instruction, whereas the ideology of development requires continual use of ex-colonial languages in the educational system and other higher institutions of the state. The ideology of development appears to be based on a wanting dichotomy: socioeconomic development is possible only through the medium of European languages versus indigenous African languages are good only for preserving African cultures and traditions. Scholars who subscribe to the use of an indigenous African language as the medium of instruction maintain that colonial schools deprived African children of their cultural heritage (Ngugi wa Thiong'o, 1983; Alexander, 1997). Also, they point to the cognitive advantages associated with the mother tongue of the learners, as highlighted in UNESCO's (1995) report on the merit of vernacular education. Those who subscribe to the ideology of development view instruction in the language of the former colonial power as an approach that will lead to greater proficiency in that language, representing a further step toward economic development and participation in the international global economy (Mfum-Mensah, 2005). It is argued that indigenous languages do not have the linguistic complexity to enable them to be used in technical and scientific contexts (Balfour, 1999, p. 107). Linguistic scholarship has, however, shown conclusively that the notion that some languages inhibit intellectual or economic development is a myth. As McArthur (1983, p. 21) explains, "all languages are equally capable of expressing whatever their users need them to express, and have equal potential, although historical events may significantly benefit or impede a particular language."

In retaining former colonial languages as official languages, language policy makers expected that the adopted European language would develop into a viable medium of national communication, that it would be adopted by the African population, that it would spread as a *lingua franca*, and perhaps eventually also as a first language by replacing the local languages, as was the case in large parts of Latin America (Weinstein, 1990). However, as the next section explains, those expectations have not as yet been met.

The African Union and Africa's Past Language Policies

The African Union (AU) is an intergovernmental organization consisting of 53 African states. It was established on July 9, 2002 and became the successor of the Organization of

African Unity (OAU). The AU's objectives are to accelerate the political and socioeconomic integration of the continent; to promote and defend African common positions on issues of interest to the continent and its peoples; to achieve peace and security in Africa; and to promote democratic institutions, good governance, and human rights (en.wikipedia.org/wiki/African_Union). With respect to language, the constitution of the AU stipulates that the organization recognizes six official languages: Arabic, English, French, Portuguese, Spanish, and Swahili. In practice, however, the AU uses mostly English and French for the conduct of its business.

This section discusses the AU's efforts to promote the use of the indigenous African languages in the higher domains, with a focus on the educational system. These efforts are made against the failure of ex-colonial languages to meet the goals for which they were retained when colonialism ended, whether in terms of bringing about national unity, national economic development, or literacy. Instead, it has become increasingly clear that ex-colonial languages do not equalize opportunities but rather reproduce socioeconomic inequalities. The essentialist sanction of European languages as the only appropriate languages of schooling has marginalized and precluded the development of African vernaculars. As Spencer (1985, p. 395) remarks, the introduction of the colonial languages into African societies, and their use as media of education and as communicative instruments for the modernizing process, froze not only competition between languages for access to new domains, but also the opportunities for functional development of almost all the African languages. It is this state of affairs that the OAU, the precursor to the AU, tried to change by championing the ideology of decolonization of African education, with the specific goal of promoting the use of the indigenous African languages as the medium of instruction in African schools. OAU (1986) articulated the need for the *decolonization of education* in what the organization called the "Language Plan of Action for Africa," among whose goals were:

- a. to liberate the African peoples from undue reliance on utilization of non-indigenous languages as dominant, official languages of the state in favor of the gradual takeover of appropriate and carefully selected indigenous languages in this domain.
- b. to ensure that African languages by appropriate legal provision and practical promotions assume their rightful role as the means of official communication in public affairs of each Member State in replacement of European languages which have hitherto played this role (OAU, 1986).

Recent recommendations to promote African languages in education and other higher domains appear in the Asmara Declaration on African Languages and Literatures of January 2000, which reads as follows:

1. All African children have the unalienable right to attend school and learn their mother tongues at all levels of education;
2. The effective and rapid development of science and technology in Africa depends on the use of African languages;
3. African languages are vital for the development of democracy based on equality and social justice;
4. African languages are essential for the decolonization of African minds and for the African Renaissance. (OAU, 2000)

Subsequent efforts to promote the indigenous languages in the higher domains have resulted in the creation of the African Academy of Languages (ACALAN). This is a Pan-African organization founded in 2001 by Mali's then-president Alpha Oumar Konaré,

4 AFRICAN UNION

under the auspices of the OAU, now the AU, to promote the usage and perpetuation of African languages among African people and to serve as a specialized scientific institution of the AU (en.wikipedia.org/wiki/African_Academy_of_Languages). Bamgbose (2006) highlights the goals of ACALAN as follows:

1. To foster the development of all African languages and empower some of the more dominant vehicular languages in Africa to the extent that they can serve as working languages in the African Union and its institutions.
2. To increase the use of African languages in a variety of domains so that the languages become empowered and revalorized.
3. To promote the adoption of African languages as languages of learning and teaching in the formal and non-formal school system.
4. To promote the use of African languages for information dissemination and for political participation to ensure grassroots involvement in the political process and demystification of the elite.

Unlike previous language policies, the AU's policies do not call for African languages to replace ex-colonial languages in education or other domains. Rather, it is expected that ex-colonial languages will assume a new role as partners to African languages, but not in an unequal relationship as is currently the case.

In sum, the policy statements presented previously, namely, the Language Plan of Action for Africa, the Asmara Declaration on African Languages and Literatures, the African Academy of Languages, and related subsequent policies, such as the African Cultural Renaissance Charter and the Statutes of the African Academy of Languages (www.acalan.org) have one goal in common: They all require every member state of the Union to take urgent measures to ensure that local African languages are used as the medium of instruction in education and ultimately as languages of administration along with ex-colonial languages, which henceforth become "partnership languages" to African languages in the enterprise of national development. One notes, however, that not all of these policy statements are matched with practical steps to use the indigenous languages in education. The failure to promote the indigenous languages in education has its roots mainly in the negative attitudes that the policy makers themselves have toward the indigenous languages.

The African Union and Attitudes Toward African Languages

Generally, the attitude of the member states of the AU and the African masses toward the use of the indigenous languages in higher domains such as education and the government and administration is negative. This stems from not only the members' deep-seated perceptions about the status of the indigenous languages vis-à-vis ex-colonial languages in society, but also the policies that govern language use in the higher domains, for they favor ex-colonial languages over the indigenous languages (Mfum-Mensah, 2005). To ensure that the indigenous languages do not compete with ex-colonial languages, policy makers formulate language policies that are either ambiguous or that embed escape clauses. The language clause in the Constitution of the AU itself is a case in point. According to the Constitutive Act of the AU, the working languages (now renamed official languages) of the Union are "*if possible*, African languages, Arabic, English, French and Portuguese" (emphasis added). Swahili and Spanish have since been added to the list of the Union's official languages. Note the escape phrase, "*if possible*." It indicates that although the AU calls on its member states to promote African languages in the higher domains, the AU itself does not seem to be bound to use these languages in the conduct of its own business.

The response of the member states to the AU's call are all too predictable. Consider, for instance, the constitution of countries such as Nigeria and South Africa, as presented in the extracts that follow. In both cases, escape clauses are marked by the use of modal auxiliary verbs such as *may* or *must*, along with complementizers such as *when*, *where*, and *if*. Accordingly, in Nigeria, parliamentary debates are usually conducted through the medium of English, while in South Africa they are conducted mostly in English or occasionally in Afrikaans because the Constitution does not specify which two of the country's 11 official languages should be used in which province or by the national government.

Language clauses in the Nigerian Constitution read:

- a. The business of the National Assembly shall be conducted in English, Hausa, Igbo and Yoruba *when adequate arrangements have been made thereof*. (The Constitution, Section 55)
- b. The business of the House of Assembly shall be conducted in English *but the House may in addition to English conduct the business of the House of Assembly in one or more languages in the state as the House may by resolution approve*. (The Constitution, Section 97). (Bamgbose, 2001, p. 193, emphasis added)

Language clauses in the South African Constitution read:

The national government and provincial governments *may use any particular official languages* for the purposes of government, taking into account usage, practicality, expense, regional circumstances and the balance of the needs and preferences of the population as a whole or in the province concerned; but the national government and each provincial government must use *at least two official languages*. (Republic of South Africa, 1996, emphasis added)

In some cases, African countries have adopted overt language policies that constitutionally ban the use of indigenous languages in public domains. In Malawi, Kenya, Sierra Leone, and Uganda, for instance, competence in English rather than in an African language is a requisite for election to public office. In the case of Uganda, it is reported that children must be competent in English to qualify for admission into the nursery schools. In this regard, Kwesiga (1994, p. 58) remarks sarcastically that "African mothers who have knowledge of English start teaching their children this language before they are born."

In other cases, however, policy makers make statements that devalue the indigenous languages vis-à-vis ex-colonial languages. For instance, Bamgbose (2001) reports on the attitude of the legislators in Lagos, Nigeria, to the proposal that Yoruba, one of Nigeria's national languages, be used as the language of debate in the House of Assembly. He notes that the legislators rejected the proposal despite the fact that about 90% of them speak Yoruba as mother tongue. The legislators themselves explain that they rejected Yoruba because its use "*is capable of demeaning and reducing the intellectual capacity of legislators*" (Bamgbose, 2001, p. 190, emphasis added). The elite's contempt for the indigenous languages betray their double-facedness in assigning official roles to these languages and thus suggesting equal status with former colonial languages.

The African Union and Prospects for the Indigenous African Languages

This final section explores the prospects for the indigenous African languages in education and other higher domains in the light of the AU's language policy declarations discussed previously. It argues that the cognitive advantages of mother tongue education cannot

serve as the sole catalyst for promoting indigenous languages as the medium of instruction. Any attempt to promote the indigenous African languages in education must be made against an understanding of why there is such a high demand, whether genuine or artificially created, for former colonial languages in education and other domains. The use of former colonial languages in education is sustained mostly by the socioeconomic value with which these languages are associated. It is not an accident that English, for instance, is spreading around the world, and that many countries, including those with no colonial ties to Britain or the United States, are aggressively promoting the use of English in their educational systems. For instance, Tollefson (2002, p. 333) reports that the governments of capitalist Korea and socialist Vietnam, and one must add communist China to this list, are taking serious steps to increase and improve English-language education as part of broad economic development programs. In Africa, former French, Spanish, and Portuguese colonies are also aggressively promoting English by making the language a compulsory subject in their educational systems. Tollefson (2002) points out that the emphasis on English in these and other countries around the world comes with an implicit promise—that dedicating vast resources to the spread of English will yield concrete economic benefits.

The literature increasingly recognizes the importance of the relationship between language use and material outcomes in the success or failure of language policies (Paulston, 1988; Le Page, 1997; Nettle & Romaine, 2000). For instance, Paulston (1988) remarks that language planning efforts are most likely to be successful if they are supported by economic advantage or similar social incentives for the minority groups. Likewise, Nettle and Romaine (2000) note that true development of a political, economic, or social nature cannot take place unless there is also development of a linguistic nature.

If the African Union is genuinely keen to promote the indigenous languages, it must require its member states to formulate language policies that take into account the relationship between the indigenous languages and the economy and vest these languages with at least some of the privileges and perquisites that are currently the preserve of ex-colonial languages. It is only through the adoption and implementation of such policies that the majority of Africa's population will be able to access functional literacy in the indigenous languages and thus participate in the social, political, and economic development of the continent. As Fardon and Furniss (1994, p. 24) say, "the dialogue between the different discourses on language can be productive to the extent that each can identify with the aims of the others in favor of a broadly conceived program to empower languages users." As long as the ruling African elite do not consider the promotion of the indigenous languages as an integral part of Africa's economic development program, and until these languages facilitate access to the wider society and economic advancement, their prospects will remain bleak, much as they have been throughout the past centuries.

Agar, Michael

MICHAEL AGAR AND KAREN RISAGER

Michael Agar is a well-known researcher in linguistic anthropology. In the field of applied linguistics more generally he is especially known for his path-breaking work on “language-culture,” a concept that calls attention to the inextricable bond between language and culture.

He was born in Chicago on May 7, 1945, moving to the San Francisco Bay Area in 1956. That same year his parents decided on a vacation in Mexico where he learned that “being a kid” was different and preferable in that country, an experience to which he attributes his lifelong interest in culture. As a high school student he became an AFS (American Field Service) exchange student to Austria. When he later enrolled at Stanford University and took an oral placement exam, the northern German professor did not know where to place him since he spoke fluently in dialect about soccer, but had never heard of Goethe.

As an undergraduate he majored in anthropology and spent his junior year working with anthropologist Alan Beals in Karnataka (then Mysore State) in southern India. He worked in the Kannarese language. Later, in 1973, he taught at the Central Institute of Indian Languages for the summer in Mysore City and had the odd postcolonial experience of interpreting between local residents and other faculty and students from northern India unfamiliar with Dravidian languages.

Undergraduate work at Stanford, followed by graduate work at the Language-Behavior Research Laboratory at the University of California, Berkeley, connected him with the then exciting development in American cultural anthropology, variously called “ethnoscience,” the “new ethnography,” and “cognitive anthropology.” Cognitive anthropology, in its early form, upgraded the Whorfian tradition of linguistic anthropology with the argument that culture is knowledge and much important knowledge is encoded in lexically labeled categories. His planned return to southern India, though, changed with the Vietnam War when he was offered a commission in the US Public Health Service and sent to work at a national center for narcotics addiction treatment in Lexington, Kentucky. To his surprise, the linguistic ethnography that he had learned worked as well in his new project—ethnography with urban American heroin addicts—as it had in traditional anthropological research. His dissertation, later a book called *Ripping and Running* (1973), presented a lexical study of addict jargon as a means to the end of understanding their world.

He left Berkeley in 1971 for a series of academic positions—University of Hawaii in 1971, University of Houston in 1975, University of Maryland in 1981. Two years of work with the state narcotics treatment agency of New York interrupted the academic trajectory from 1973 to 1975. There were numerous visits, to the Institute in India, described above, as well as to the University of Surrey, the University of Vienna, and the University of California. And in 1995 he resigned his professorship at the University of Maryland, College Park with an emeritus title to work independently as Ethknoworks, first in the Washington, DC area, and since 2005 in northern New Mexico near Santa Fe.

His projects, whether short or long term, have always been linguistic and ethnographic at their core. In writings about ethnography, he introduced the concept of “rich point” (1996), meaning a difference based on experience that indexes a major cultural difference worthy of attention as a research focus. The concept was used by colleagues as part of a

field-oriented year abroad program for undergraduate language learners (Roberts, Byram, Barrio, Jordan, & Street, 2001). However, this biography will only describe a few periods of concentrated linguistic work.

The first period came courtesy of a Research Career Development Award from the National Institutes of Health (NIH). During research with heroin addicts in New York City in the early 1970s he did an extensive series of life-history interviews with Herbert Huncke, a lifelong heroin addict who was the street connection for the postwar Beat Generation. Agar began collaboration with Jerry Hobbs, a natural language artificial intelligence researcher at Stanford Research International. While both were focused on the problem of how to make background knowledge for text understanding visible, Hobbs worked on axiomatic formalization of a knowledge base for computational implementation, while Agar aimed for interpretive adequacy for a particular social category of outsider/audience in accessible prose. Out of this collaboration came several articles describing an approach to discourse analysis in three dimensions of coherence (or lack of it)—local (utterance by utterance), global (utterance in the context of text as a whole), and thematic (the recurrent threads of particular ethnographic interest). One contribution, “How to Grow Schemas out of Interviews” (1985), summarizes a result of particular interest to anthropologists, something that would later be called the language-based analysis of “cultural models” in anthropology.

A second period of concentrated work resulted from several visits to the University of Vienna, with support from Ruth Wodak, professor in applied linguistics at the Institut für Sprachwissenschaft. During these visits Agar researched, taught, and attended conferences, working in Austrian German, and finished up with a sabbatical year in 1989 where he started his book *Language Shock: Understanding the Culture of Conversation* (1994a). In that book he modified Paul Friedrich’s concept of “linguaculture” into the core concept of “languaculture,” meant to call attention to the inextricable bond between the two. That concept proved useful as different applied linguistic fields took a “cultural turn,” such as second language instruction’s move away from a focus on literature and lexicon/syntax to communicative competence in contemporary life. The book from 1994 has gained a wide public in language studies and its interdisciplinary approach and many illustrative examples have been an inspiration for scholars and students alike (see, e.g., Risager, 2006 for a development of the concept of “languaculture” from a sociolinguistic perspective).

The third period of work is now in process. As he phased out of academia in the 1990s, Agar experimented with possible linguistic anthropological applications, reflected in publications on peace negotiation (1996), intercultural communication (1994b), drug research (2005), and organizational discourse (2006). But for many reasons not important for this biography, he spent several years on an NIH-funded project that combined ethnography, economic history, and epidemiology, as well as doing various workshops and consultations around complexity and organizational development for social services. What is relevant to mention is that several projects and presentations took place in Latin American settings, in Spanish, a language he has worked at learning since that childhood trip to Mexico.

Recently, he has returned to language, this time as a central component in human social research, beginning with a public lecture on what makes for a “real” ethnography (later revised and published, 2008). He revisits the notion of ethnography as translation, an interest that dovetails with the exponential growth of the translation field (2011). Courtesy of a reconnection with Jerry Hobbs, mentioned above, he works with a team charged with figuring out how to enrich computer-based language instruction with “culture,” the scare quote meant to signal how difficult and contentious that concept has become in our post-structural era. This line of work is ongoing, linked to his general project to “upgrade” the culture concept for use in a globally connected world, with a renewed interest in the mix of human universals and local specifics that makes translation possible at all.

Agar currently lives with his partner Ellen about 15 miles outside of Santa Fe, New Mexico. Beside his work at Ethnknoworks and his emeritus appointment at the University of Maryland, College Park, he is an affiliate of the Anthropocaos institute at the University of Buenos Aires and a Distinguished Scholar at the International Institute of Qualitative Methods, University of Alberta. In addition to his current languaculture project, he also works with the biology faculty at the University of New Mexico on the integration of human social research and urban ecology into their program. Information on recent talks and short-term projects can be found on the Ethnknoworks website at www.ethnknoworks.com. He recently won second prize in the *Santa Fe Reporter* fiction competition.

Age-Appropriate Instruction and Assessment for School-Age Learners

CARMEN MUÑOZ

The recent trend toward teaching foreign languages in primary and pre-primary school has enriched the education of young populations in many parts of the world while at the same time it has brought about new challenges for teachers, schools, and educational systems. Mainly, the inclusion of young learners in the foreign language teaching agenda has made evident the importance of age-related differences among learners and has emphasized the relevance of research results for the provision of age-appropriate instruction and assessment.

Is Younger Better? Research Perspectives

Studies that have compared younger and older language learners in second language settings show that the former attain higher levels of proficiency than the latter after a long period of immersion, and that their most outstanding advantage is found in the area of pronunciation. The obviously high success rate of those learners who arrive early in the second language country as compared to those learners who arrive at a later age has contributed to extend belief in the maxim “the younger the better.” One likely explanation for the young learners’ superior language learning potential lies in their use of implicit learning mechanisms (namely, the same learning mechanisms used by children in first language acquisition) to discover grammatical regularities and phonetic patterns merely from language exposure. However, for implicit learning to occur learners require massive exposure to the language, the type of exposure that children learning their first language or learning a second language in an immersion setting have (DeKeyser, 2000). When children have no access to unlimited exposure to target language input, as is typically the case in foreign language settings, this potential advantage cannot be realized, which explains why in instructed contexts with limited input younger starters have not shown superior outcomes when compared with older starters after the same amount of hours of instruction (García Mayo & García Lecumberri, 2003; Muñoz, 2006). Likewise, the young learners’ advantage in the perception and production of new sounds may be related to the weaker entrenchment of L1 in children than in adults. However, their age advantage can facilitate phonological acquisition of a new language only in the presence of quality input from which new phonetic representations can be formed. In the absence of quality input the young learners’ perceptual and productive advantages have not been observed to be realized either. In sum, research has shown that young age does not automatically confer an advantage on young learners if they do not have the amount and intensity of exposure as well as the quality of input required for their learning potential to be instantiated.

Studies that have compared younger and older language learners in both second and foreign language contexts have yielded another consistent finding: Older learners have a faster rate of learning in the beginning stages and hence they are more efficient learners, particularly in the domain of grammar (Snow & Hoefnagel-Höhle 1978; Krashen, Long, &

Scarcella, 1979). In foreign language contexts, other studies have compared early starters and late starters at the same age, with the former having had considerably more exposure than the latter. These studies have also shown that late starters are able to catch up with early starters after some time in literacy-related domains (Muñoz, 2008).

Age-Appropriate Instruction and Assessment

Surveys examining early language teaching programs have shown that learners' young age does not guarantee efficient learning by itself (Edelenbos, Johnstone, & Kubanek, 2006). Contrary to the simplistic belief that "younger" is automatically "better," teaching young learners requires extreme care and finely tailored programs. For school-age children to benefit from early instruction in a foreign language they must have age-appropriate instruction in addition to continuous access to meaningful, immersion-type, quality input, and opportunities to engage in genuine interaction.

Age-appropriate instruction is learner-centered. Consequently, learning tasks need to take into account learners' cognitive and affective characteristics, their preferred learning styles, interests, and patterns of interaction (Muñoz, 2007). It is generally agreed that children learn holistically, and a whole-language approach is required when teaching young learners. A number of characteristics have been identified for syllabus, input, tasks, and topics that are appropriate for young children. The syllabus should be theme-based, around either topics, stories, projects, or tasks, to allow the integration of the target language into the curriculum. The input to young learners should be embedded in context; it should present structures and functions in spiral sequence, with frequent repetition of patterns to allow for induction of rules and generalization; and it should offer a high-quality model for the learners to imitate. Given young children's advantage in perceiving and producing new sounds and prosodic patterns, there should be a very strong emphasis on phonetics and prosody in this period. Language learning tasks should have a focus on listening and speaking skills; the tasks should be short and varied because young learners have a short attention span; activities should refer to the "here and now," consonant with children's stage of cognitive development; and there should be an emphasis on hands-on activities because young learners need "to do things." Topics for young learners should motivate children and engage their interest.

On the other hand, the superior efficiency of older learners draws on their advanced cognitive development. Age-appropriate instruction for older learners is tailored to this strength: as learners grow older they develop their analytic ability and are better able to handle an analytical approach of linguistic structure. By the end of primary school, learners can benefit from direct teaching and systematic practice, and input can be disembedded from the immediate context; in particular, learners can benefit from focused phonetic training and from activities that direct their attention to form and improve target language accuracy. Maximum benefit can be derived when this practice is balanced with meaningful language tasks, as in a task-based syllabus. In other words, while maintaining a focus on meaning that satisfies learners' communicative goals, a more explicit focus on form can support learners' receptive and productive abilities as well as foster their metalinguistic awareness. Topics for older learners need to be connected with their age-group interests and possible professional concerns in high school.

Age-appropriate assessment must reflect the approaches used in teaching the different age groups. In particular, assessment for young learners should be supported by tasks that are familiar and cognitively adequate, contextualized and enjoyable, yet challenging at the same time. Assessment for older learners focuses on their communicative abilities while at the same time it challenges learners' knowledge of and reflection on language structure.

At any age, the activities used in assessment of school learners should be designed to highlight what the pupils can do; the activities should be formative and constitute good learning activities in themselves.

The Role of Motivation

Age-appropriate instruction promotes learners' motivation toward the target language. In fact, it has been suggested that the highest benefit of the early introduction of a second language lies in the domain of motivation (Blondin et al., 1998). Motivation may vary also in relation to the frequency of instruction, so a low level of contact with the language does not usually trigger very high levels of motivation. Qualitative and quantitative changes have been observed in learners' attitudes toward the foreign language over the years at school. Young learners show an intrinsic type of motivation, but in the middle years of school education this may wane, and later tends to be replaced by an instrumental type of motivational orientation. This is the case when the target language is English, but learners may vary in their attitudes to other languages and view them differently in terms of their importance as a life skill.

Although studies have provided conflicting evidence regarding the relationship between foreign language "liking" and age, a decrease of positive attitudes after an early start has often been observed around the years of puberty. When learners start secondary school their interest also tends to wane after one or two years. Different reasons may explain these changes over time: the assimilation of the foreign language to other school subjects, especially when lessons become less communicative and more academically demanding; the generally negative attitude toward the school that characterizes the beginning of adolescence; and the disappearance of the novelty factor that inflates motivation at the beginning of instruction (Tragant, 2006).

Conclusion

To guarantee future success, early start programs need to draw on adequately trained teachers and to provide enough contact with the target language and the necessary resources. At the same time, educational and school policies should ensure consistency and continuity from one educational cycle to another. In the end, early start programs need to be accountable for whether the expected learning has taken place, and for the consequences of an early start in more general educational terms.

Agency in Second Language Acquisition

TOMOKO YASHIMA

Significance of Agency in SLA: An Overview

The concept of learner agency has been significant to applied linguistics and SLA for a long time. This is despite the fact that the term “agency” started to appear in SLA research articles fairly recently, influenced by sociocultural and poststructuralist theories. To understand the significance of agency in SLA, we need to overview the history of SLA as a discipline as well as its development and expansion.

With the advent of the so-called cognitive revolution brought about by Chomsky (1959) and others, research and pedagogy in SLA influenced by behaviorism (e.g., audiolingualism) gave way to cognitive psychological perspectives that regard language acquisition as a cognitive process. Unlike behaviorists, who see our actions as being at the mercy of external forces (that is, as reactions to stimuli and habit formation), cognitive psychology places human cognition at the core: humans think, memorize, and try to understand and make meaning (William & Burden, 1997). Unlike the behaviorists’ view of humans as passive or reactive, people are now regarded as active participants in the learning process, that is, as agents who can make choices regarding their behaviors and who have control over their actions and are therefore “agentive.” This has influenced research on the psychology of L2 learners, including research in motivation (William & Burden, 1997).

During the 1980s and 1990s, cognitive-interactionist models, which focus on learners’ cognitive processes of L2 acquisition through interactions with external factors (Ortega, 2009, p. 55), represented by, for example, the input, interaction, output, and noticing hypotheses, became mainstream in the field. In the mid 1990s a new trend characterized as the “social turn” (Block, 2003; Ortega, 2009) set in, along with calls for research informed by social theories. With this new trend, which encourages researchers to turn to the sociocultural contexts in which language learning takes place, a new conceptualization of agency emerged. Within this broadly social approach, second language learning is seen as embedded in sociocultural and macrosociopolitical contexts. Viewing language learning as purely a cognitive process has been criticized because the approach fails to account for contextual forces and the sociocultural mediation that necessarily affect language learning.

In Vygotskian sociocultural theory, the development of higher mental functions in a child is seen as originating in his/her interactions with adults, mediated by physical and psychological tools. A child gains agency as he or she develops mental functions that allow for greater self-regulation. Using this approach, SLA research also regards social interactions and guidance by more capable others as significant. As the novice gains greater ability to function autonomously, the experts relinquish control to him/her at the appropriate time (Lantolf & Thorne, 2006, p. 280). Since the social contexts surrounding individuals differ from person to person, the emphasis of research within this framework has shifted from universal processes of SLA toward paying attention to the unique situations in which language acquisition takes place. As a result, individual learners’ histories, learning trajectories, and identities are taken into consideration and accounted for.

Another important factor that has influenced the view of agency in SLA is post-structuralism. As part of a move away from a structuralist (e.g., Levi-Strauss) toward a poststructuralist theorization of human activities and culture, the complete denial of agency, as in structuralist discourses, has been challenged. Although human beings are not free agents but are constrained by social structures and forces, neither are they mindless beings, entirely controlled and structured by these structures and forces. Thus research in SLA informed by poststructuralist thought examines power relations embedded in the sociopolitical contexts in which people learn an L2 as well as the agency they exercise in overcoming the challenges they face in that learning. Within this framework, agency often refers to the ability to analyze the situation critically in which the learner is placed and to resist the forces that obstruct making changes in that situation.

Theoretical Perspectives on Agency in SLA

In the following sections, concepts of agency from: (a) psychological (focusing on learner characteristics including motivation), (b) sociocultural, and (c) poststructuralist/critical perspectives within the field of SLA will be discussed.

Agency in Psychological Research on Learner Characteristics

Within psychological research in SLA, agency is most closely associated with motivation. Motivation research places human agency at its core. In many L2 learning motivation theories, learners' sense of agency is regarded as crucial in enhancing motivation to learn the language. From a self-determination theory perspective, the learners' perception of how much agency they have in choosing to do what they do is vital for sustained motivation. From an attribution theory standpoint, the learners' explanation for the causes of past successes and failures is seen as determining their future course of action, while self-efficacy theory stresses the view that the learners' own evaluation of their ability to perform certain actions will determine the amount of effort exerted (Dörnyei, 2001).

Agency is also conceptualized in terms of self-regulatory capacity, which refers to cognitive, metacognitive, behavioral, and affective processes that learners apply to enhance learning. One aspect of this discussion focuses on the language learning strategies that learners use consciously to plan, execute, and regulate their learning. Within this framework, strategy training, or training learners to rely on greater self-regulation, is not only possible but also desirable because it "can improve learners' sense of agency" as well as their "motivation, confidence, and L2 performance" (Oxford, 2003, p. 85). Like autonomy, agency is regarded as a psychological attribute that affects human behavior.

From this perspective, the social context, also referred to as the "milieu," is considered important and usually regarded as a set of social variables that influence the learner's cognition, affect, and behavior. Since much of mainstream research on motivation and learning styles and strategies has focused on generalizable relations among variables using quantitative methods, it has not necessarily succeeded in describing how an individual learner exercises agency in his or her specific learning context. Recently, however, the SLA field has seen more qualitative studies being published. This is partly because, under the influence of a social orientation, L2 learning is increasingly regarded as embedded in social contexts, and this aspect of L2 development can be more effectively studied through qualitative methods.

Agency From Sociocultural Perspectives

As part of the recent trend toward more socially informed SLA research, sociocultural theory has attracted much attention. According to Wertsch (1991), the goal of sociocultural

analysis is to understand how human cognition is related to cultural, institutional, and historical contexts. To account for agency from sociocultural perspectives, the Vygotskian theory of mediation, the internalization of self-regulation, and activity theory are taken up in this section.

According to Vygotsky (1997), all forms of higher mental functions are derived from interpersonal interactions mediated by culturally constructed auxiliary tools, whether physical or symbolic, with language as an example of the latter. While physical tools such as a hammer or scissors “extend the reach and power of our bodies” resulting in “a change in the object toward which they are directed” (Lantolf & Thorne, 2006, p. 60), linguistic artifacts are inwardly directed, with the goal of self-regulation (Vygotsky, 1997). At first, children are dependent on assistance from adults when they perform certain tasks, often with linguistically mediated support. Through dialogic interactions with others, children learn to self-regulate their physical and mental activities using mediational devices, and they gradually become independent of adult guidance. This process enhances a child’s agency. The distance between what a child can do independently and what he or she can achieve with the guidance of adults or more experienced others is called the “zone of proximal development.” According to Lantolf and Thorne (2006), there are no uniquely human actions that are not mediated, and “human agency appears once we integrate cultural artifacts and concepts into our mental and material activity” (p. 63). Agency, in this sense, refers to internalized self-regulation or “the socioculturally mediated capacity to act” (Ahearn, 2001, p. 112). Further, as Newman and Holzman (1993) argue, uniquely human activity mediated by culturally created tools is also transformative and creative as humans constantly make changes in the emerging activity (p. 49). In this sense, agency refers to the mediated capacity of humans to create and make changes.

Extending these perspectives to L2 learning, SLA researchers often examine L2-mediated private speech (externalized inner speech) as well as dialogic interactions between L2 learners and teachers in order to understand the process of how learners learn to self-regulate their second language use and how they mediate their thoughts through a second language by, for example, using concepts learned in an L2.

Activity theory is a framework for studying human practices as developmental processes (Lantolf & Thorne, 2006, p. 209). In other words, activity is a social practice that provides conditions for psychological development. Human beings in every day situations respond to tensions, contradictions, and problems that to some extent change the conceptual, social, and material conditions of their lives. In this sense, tensions, contradictions, and problems create opportunities for human development, often through the creation of new artifacts. While Vygotsky created a model of individuals’ goal-oriented, mediated activity that generates higher mental functions, later theorists such as Leont’ev (1981) have stressed the roles that community, rules, and labor-sharing play in structuring the activity. Lantolf and Pavlenko (2001) argue for the importance of using the activity theory framework in discussing agency in SLA. They stress that second language acquisition as activity is “more than the acquisition of forms.” Rather, it is about developing “new ways of mediating ourselves and our relationships” (p. 145) with the world. This perspective requires us to respect learners’ agency in “constructing the terms and conditions of their own learning” (p. 145) within the social context in which they are placed.

L2 researchers working within this framework try to investigate the unique situation in which each individual is placed when he or she learns the second language and how agency is exercised in that situation. For example, Coughlan and Duff (1994) focus on learners’ agency in making sense of tasks used in language classrooms. They show how the objectives of a language-eliciting task designed by researchers are interpreted differently by different learners and that what is conceived as the “same task [leads to] different activities” (p. 173) for different learners based on their learning histories, interests, capacities,

and so on. This means that even though teachers have learners do tasks aiming at the acquisition of certain linguistic features, each individual creates different activities with the personal objectives and meanings that he or she attaches to the task.

Engeström's (1987) activity theory model presents a framework for analyzing the development of a human community, allowing a focus on both systemic and individual transformation. For development to happen, a group of individuals transforms its practices and introduces new ones, overcoming contradictions and creating new tools in the process. For Engeström, agency involves the capacity of human beings to collectively make changes, overcome what is given, and generate something new. In Lave and Wenger's (1991) theory, on the other hand, learning is regarded as a situated activity amounting to legitimately participating in a "community of practice" in which an individual is mediated not only by material and symbolic tools but also by the formation of social relationships that are emergent and contingent. Learning involves changing relationships as well as transforming identities within one's social world. In conceptualizing L2 learning under the influence of activity theory and situated learning theory, a new "participation" metaphor has emerged in addition to the traditional "acquisition" metaphor (Sfard, 1998). Unlike the psychological conceptualization of agency discussed above, agency from this perspective is "never a 'property' of a particular individual: rather, it is a relationship that is constantly co-constructed and renegotiated with those around the individual and with the society at large" (Lantolf & Pavlenko, 2001, p. 148). In this sense, agency is a "culturally (in)formed attribute whose development is shaped by participation in specific communities of practice" (Lantolf & Thorne, 2006, p. 239).

Agency From Poststructuralist and Critical Perspectives

The relationship between social structure and human agency has long been debated in social theories. While phenomenology and ethnomethodology focus on the subjective world of humans and privilege the actor, functionalism and structuralism stress the power of the structure and systems of meaning to control agency. Bourdieu's and Giddens's theories offer concepts that bridge agency and structure, or the gap between the micro and macro perspectives (Smith, 2001). Bourdieu's (1977) concept of "habitus" helps us analyze how the reproduction of social structures is interconnected with individuals' subjective experiences embedded in day-to-day practices and manifested in embodied behaviors and tendencies to act in specific ways as well as in their tastes and emotions, among other factors. In Giddens's (1984) structuration theory, on the other hand, structure and agency are mutually constitutive within social practice. Giddens suggests that humans act using internalized skills and knowledge in every day practice, while cultural patterns are reproduced as humans use their skills and knowledge in social practice. Thus not only is structure the medium for human actions but it is reproduced as a result of these actions. Actors have agency in the sense that they are the source of intended actions, which may result in unintended consequences. In Giddens's view, humans continuously have reflexive moments to monitor the consequences of their actions while engaging in day-to-day practices. Through this reflexivity, humans have agency in that they can make choices and enact changes to their environment.

Both Bourdieu's and Giddens's theories thus provide us with a framework for viewing agency in L2 learners by focusing on the dialectic of social structure and agentic actions. This combined perspective suggests that L2 learners have the power to change the cultural patterns (e.g., power relations) that affect them by being reflexive and changing both themselves (their "habitus") and these patterns.

Within the framework of SLA informed by poststructuralist critical theories, an increasing number of studies have been conducted focusing on L2 learning by immigrants or those who are forced into subject positions in society, demonstrating their struggles in appropriating the new language while fighting social constraints and negotiating an identity (e.g., Norton, 2000; Block, 2007). Researchers discuss how individuals' sense of motivation, anxiety, or willingness to communicate as well as their communicative competence are socially structured in inequitable relationships between native and nonnative speakers or in other power relationships embedded in the context (e.g., Norton, 2000) rather than seeing them as variables that account for individual differences. Researchers also focus on individuals' agency in critically reflecting on the positions in which they are placed and in taking more strategic positions to stand up from marginalized positions and to liberate themselves from imposed identities. These researchers discuss the dialectic of the learners' agency and the structures—or social forces—that constrain their choices, particularly in migrant contexts. In this sense, agency is not a property of free and autonomous individuals. Instead, it describes the human capacity not only to resist imposed subject positions but also to make choices and change the course of one's life, to create new ways of being, and to look for "cultural alternatives" (Pennycook, 1997, p. 35). In other words, agency is the "power to control one's situation, be fully heard, be free from oppression, and have choices" (Oxford, 2003, p. 79).

Agency and L2 Teaching

The concept of agency has carried significance and been appropriated by applied linguists with different theoretical perspectives. In all of them, agency has involved the learners' capacity to make choices and change themselves and/or the environment.

In psychological approaches to SLA, agency is regarded as an attribute of individuals that affects their learning behaviors (Oxford, 2003). In this framework, enhancing agency is equal to increasing the capacity for self-determination or for making choices about learning as well as the self-regulation of learning behaviors. Within the sociocultural framework, on the other hand, agency refers to one's capacity to act through the mediation of culturally created tools as well as guidance by more capable others rather than to a property of individual learners. Therefore, teachers' and co-learners' involvement is regarded as crucial in offering mediation—or scaffolding—to learners in the zone of proximal development that will lead to self-regulation and independence. From an activity theory perspective, learning an L2 is equal to participating in a community, where the L2 mediates the learner's involvement in new activities and in forming new social relationships in the community.

Finally, from a poststructural viewpoint, as in Pennycook's (1997) discussion of autonomy, L2 teaching should "help [their] students become authors of their own worlds" (p. 45). Pennycook calls for socially, culturally, and politically engaged forms of L2 teaching that can help learners exercise agency because learning a language is more than mastering a system: it is also a matter of "struggling to find means of articulation amid the cultures, discourses, and ideologies within which we live our lives" (pp. 48–9). From a postcolonial critical perspective, Canagarajah (1999) points out that those studying English in postcolonial communities in the developing world often find themselves in painful conflict, torn between Western and indigenous cultural values. Among many ways to cope with this situation, Canagarajah calls for teaching practices that encourage learners to "have the agency to think critically and work out ideological alternatives that favor their own empowerment" (p. 2).

Conclusion

As we have seen, agency has been conceptualized by researchers in SLA in different ways, and the evolving nature of the concept represents the development of both applied linguistics and SLA as growing fields. In a globalizing society, in which people increasingly move around the globe for many different reasons and where information technology brings people together in virtual worlds, people's movements and communication often involve second language learning and the reconstruction of selves. Individuals are not entirely free in how they choose ways of life or identities because they are embedded in social structures that constrain their freedom. Yet faced with a variety of choices and constraints, human agency is becoming a key concept for people living in the present world, particularly those who try to craft new identities by learning a second language.

Alderson, J. Charles

JAYANTI BANERJEE

In a humorous tribute to his parents, the dedication in Charles Alderson's oft-quoted publication *Assessing Reading* (Alderson, 2000) reads: "I only hope they would not have been too disappointed that I did not become the Town Clerk of Burnley, as my mother hoped." Though he failed to follow that exact path, Alderson's mother accurately predicted that his work would have a wide sphere of influence. Indeed, he has been described as "a major force in the advancement of language testing for the past 30 years, particularly in Europe" (ILTA Lifetime Achievement Award Committee, 2008—<http://www.iltaonline.com>).

After graduating from Oxford University with a BA (Hons) in French and German, Charles Alderson (1946–) worked briefly as a marketing executive for Reckitt and Colman Ltd., selling Colman's mustard. After two years he took a position as *lektor* (language teacher) in English at Düsseldorf University, beginning a distinguished career as an educator and researcher. Alderson first became involved in language testing as a PhD student at Edinburgh University where he was coordinator of the English-language testing service and, among other duties, was responsible for administering the English Proficiency Test Battery (EPTB) (Davies, 1965). During this time he also co-authored version D of the EPTB (Davies & Alderson, 1977).

Since receiving his PhD in 1977, Alderson has worked at three major institutions. He spent approximately two years at the National Autonomous University of Mexico where he was Head of the Research and Development Unit as well as the General Coordinator of the Department of Applied Linguistics for the Modern Language Center (CELE). Following this, Alderson was briefly at the University of Michigan as the Director of Testing in the English Language Institute. Since 1980, he has worked at Lancaster University, where he is Professor of Linguistics and English Language Education and can be largely credited with the growth there of a vibrant and internationally renowned teaching and research program in language testing.

It is hard to adequately summarize the different aspects of language testing to which Charles Alderson has contributed in his career. He has published papers on a variety of subjects including reading assessment, ESP testing, diagnostic testing, politics in language testing, and language-testing standards. Many of his publications have addressed or reconceptualized key issues and concerns. His PhD study of the cloze procedure was not just a leading issue of the day but one that has proved a perennial interest (see Kobayashi, 2002; Dastjerdi & Talebinezhad, 2006). Alderson and Wall (1993) and Wall and Alderson (1993) were seminal contributions to investigations of washback. The former was awarded the ILTA best paper award in 1993; it challenged the prevailing assumptions that bad tests have a deleterious effect upon teaching and that good tests promote good teaching. It completely reframed washback as being far more complex than a simple cause–effect relationship, and this sparked a fascinating body of research including Wall (2006) and Cheng (2006). More recently, in a monograph on diagnostic testing, Alderson (2005) describes DIALANG, a pan-European project to design and deliver diagnostic tests in 14 European languages. This is the most thorough treatment currently available of the practice of diagnosing language development.

Importantly, Alderson has actively engaged in and initiated debates about language-testing theory and practice. Alderson and Lukmani (1989) and Alderson (1990) critically examined the assumption that items testing higher-order reading skills (such as distinguishing between the main idea and supporting detail) were more difficult for the test taker. They found that expert judges are often unable to agree on what an item is testing. They also found that the skill being tested does not accurately predict the item difficulty. These papers generated much debate in the field, including a response by Lumley (1993) who counterclaimed that, with adequate training, judges could reach substantial agreement on the skills being tested by individual reading-test items. Perhaps more controversially Alderson worked with colleagues at Lancaster University to survey the practices of British examination boards engaged in EFL/ESL testing (Alderson & Buck, 1993). This survey named and shamed a number of well-known examination boards and was the starting point for the now classic text *Language Test Construction and Evaluation* (Alderson, Clapham, & Wall, 1995), which was aimed at helping teachers understand “what constitutes good testing practice . . . [in order] to make more informed choices to suit their purposes” (Alderson et al., 1995, p. 1).

It might even be argued that one of Alderson’s key concerns during his career has been to hold professional language testers and educators accountable for their actions. His edited collection *The Politics of Language Education: Individuals and Institutions* (Alderson, 2009b) presents a number of vignettes showing the motivations and agendas of individuals and organizations which can certainly influence and often compromise innovation in language testing and education. Most recently, Alderson has investigated standards of language testing in the field of aviation English testing (Alderson, 2009a, 2010), quite rightly pointing out that every airline passenger has a stake in the quality of aviation English language testing.

In addition to maintaining a prolific publication profile, Alderson coedited (with Lyle Bachman) the influential *Cambridge Language Assessment Series*, the source of key reference books in the field. He also served as coeditor (once again with Lyle Bachman) of the journal *Language Testing* for four years (1997–2001) and as series editor for *Into Europe: Prepare for Modern European Examinations*, a collection of four volumes documenting the Hungarian Examination Reform Project (<http://www.examsreform.hu/Pages/Projects.html>).

Alderson has led a number of important language-test development projects such as the ELTS Revision Project (1986–9), which resulted in the International English Testing System (IELTS). He was also the scientific coordinator for DIALANG (<http://www.lancs.ac.uk/researchenterprise/dialang/about>). In addition, he has been a key advisor to test-reform projects in Europe, including the Hungarian Examination Reform Project, the Slovenian Year 9 Test Project, and the Austrian Matura Neu Project. Alderson has also managed significant language-testing research projects, including the development of proficiency tests in Sri Lanka, an investigation into the washback of the revised O-level examination on Sri Lankan classrooms (Wall & Alderson, 1993), and the Dutch CEFR Construct Project (Alderson, Figueras, Kuijper, Nold, & Tardieu, 2006). The latter explored the extent to which the language proficiency scales described in the Common European Framework of Reference for Languages: Learning, Teaching, Assessment (CEFR) (http://www.coe.int/t/dg4/linguistic/cadre_en.asp) could help test developers to construct listening and reading tests. The project team identified many areas in which the CEFR provides insufficient guidance because of inconsistencies, lack of definition of words, and gaps in the description of particular levels. Despite these difficulties, the team was able to develop a rigorous grid (<http://www.lancs.ac.uk/fss/projects/grid/>) that can help test developers analyze their listening- and reading-test materials in order to estimate the CEFR level being assessed. However, they cautioned against using the grids on their own, reminding us of the importance of pretesting: “to know whether a given item is indeed at the level of difficulty intended, piloting on suitable samples of test-takers is crucial” (Alderson et al., 2006, p. 19).

As is probably evident, Alderson's influence has been particularly felt in Europe, where he has been a leading voice on language-testing matters. He was a consultant to the Council of Europe for the pilot edition of the manual to relate language examinations to the CEFR. He was also the project leader for the ENLTA project (European Network for Language Testing and Assessment), a project funded by the European Commission from 2003 to 2005 with the express purpose of creating the European Association for Language Testing and Assessment (www.ealta.eu.org). The aim of EALTA is to be accessible to anyone engaged in language testing and assessment in Europe in order to encourage the sharing of expertise and information about theory and practice in the field. This aim appears to have been achieved already. Approximately 200 people attend the annual conference, and in May 2010 there were over 1,000 individual members and 52 institutional members.

Finally, as is often the case with exemplary scholars, Alderson has been particularly influential in his role as mentor and teacher. He has supervised 35 PhD students, four of whom have won the prestigious Jacqueline A. Ross TOEFL Dissertation Award (http://www.ets.org/toefl/grants/jacqueline_ross_dissertation_award). A number of other former students have risen to prominence in the field. He has guided a wide variety of student research projects, including Van Moere's (2007) investigation of the group oral, in particular the effect of different tasks upon performance and test scores, Papageorgiou's (2009) study of the role of judges in standard setting, and Hondo's (2009) second language acquisition study of timing in form-focused intervention. In doing so, Charles Alderson's contribution to the field of language testing specifically and applied linguistics more generally is amplified many fold.

Allwright, Dick

LEO VAN LIER

Overview of Dick Allwright's Career

Dick Allwright (1938–) is one of the most influential applied linguists in the field. His main areas of interest bridge theoretical and practical concerns in the area of language education and he is the originator of an innovative and increasingly influential pedagogical movement called Exploratory Practice (EP). His work has always been closely connected to the actual language classroom and has probed the intricacies of interaction, relationships of control, and the interface between teaching and learning.

Dick started his career as a language teacher. He originally trained to teach primary French in the United Kingdom, but instead taught English to adults in Sweden for two years (1965–7) before going to study applied linguistics at the University of Edinburgh, where he obtained his MLitt in 1972. From 1969 to 1978 he taught applied linguistics at Essex University. At Essex, Dick pioneered language classroom research, a research interest that he continued after moving to Lancaster University in 1978. At Lancaster his interest in classroom research shifted toward research as a contribution to teacher and learner development, via the notion of EP, a form of practitioner research involving teachers and learners working together, during language lessons, to explore and develop their understandings of their classroom lives.

During his years at Essex and Lancaster universities Dick was a visiting professor in a number of different universities, such as UCLA, University of New Mexico, Teachers College at Columbia University, Michigan State University, Carleton University in Ottawa, and the University of Minnesota.

While at Lancaster University, Dick obtained his PhD in Applied Linguistics in 1992. In the late 1980s he established the Centre for Research in Language Education at Lancaster. More recently he established the Exploratory Practice Centre, also at Lancaster University, but with a steering group membership including researchers in Azerbaijan, Brazil, China, and England. In retirement he continues to help coordinate and in other ways to contribute to the work of the now Rio-based Exploratory Practice Centre, which includes at least one joint teacher and learner conference a year, and the maintenance of a dedicated Web site (<http://www.letas.puc-rio.br/oldepcentre/epcentre.htm>).

Retired since 2003, he is still actively pursuing his interest in teacher, and especially learner, development. In 2009, with Judith Hanks, he published his third book, *The Developing Language Learner: An Introduction to Exploratory Practice* (2009a). Since 2004 he has been editing the Practitioner Research section of the *Language Teaching Research Journal*.

Classroom Research

Dick Allwright's first major research interest was classroom research. An early paper (1975) looked at the teacher's treatment of learner errors and is still well worth reading for thoughtful and insightful comments on this perennial topic. Another seminal paper is his look at classroom motivation and to what extent this might be the teacher's responsibility

(1977a). A very influential paper (1980) on the analysis of classroom interaction is often referred to by Dick's students as "TTT" or "Igor" (after a highly active yet not very successful learner in the particular language class that was analyzed). At the time, Dick advanced the (then revolutionary) idea that in classroom research one should not make a priori assumptions about role distinctions between teachers and learners, since these roles should emerge from the data. His approach, therefore, was a strongly emic one that contrasted with most studies of classroom discourse at that time. In 1988 Dick published his influential book *Observation in the Language Classroom* (1988a) and this was followed in 1991 by *Focus on the Language Classroom* (with Kathleen M. Bailey), which is still widely used as a text in graduate applied linguistics programs.

Exploratory Practice

Since the early 1980s Dick's work and thinking has gradually moved toward an integrative EP approach to classroom life, incorporating teachers, learners, and other stake holders in all the activities relating to learning, teaching and researching. While this approach is superficially similar to action research, it actually goes far deeper than the usual applications of action research and rejects a currently common interpretation of action research as an approach to problem solving, or as a tool for teacher training. By regarding action research as a form of activism in the exploration of enduring problems (or "puzzles") of language pedagogy, and not simply as a way of "fixing problems," EP comes close to the ideal of Kurt Lewin's (1951) original conceptualization of this form of research. However, Dick's approach is unique in that it seeks to involve the learners as equals in the research process and rejects treating teachers and learners as "subjects" who are not fully involved as agents in the reasons and practices of the research. In EP, all learning is a form of research, aimed at understanding the full complexity of language learning, in the classroom as well as in the wider context.

Analysis of Dialogue

CHRISTOPHER JENKS

A dialogue is broadly defined as an exchange of spoken or written ideas, thoughts, and, opinions between two or more interactants. Dialogues are not monologues in that the former involve reciprocation of communication. For example, if one person speaks, then the other person is expected to respond in turn. Reciprocity within dialogues varies in temporality. A dialogue can take many months or even years to complete, as in the case when one book author responds to another. In other situations—namely face-to-face communication—dialogues can end in a matter of seconds. Although, in practice, dialogues occur in a number of different situations and take place over varying degrees of time, the analysis of dialogues within applied linguistics is typically concerned with concurrent spoken interaction. This entry will discuss dialogues from this narrower conceptualization.

Dialogues

Most interactants go about their daily lives with little thought of how their dialogues with others are organized, and what role communication plays in organizing the world around them. This is because communicative encounters are often so mundane that the complexities of managing a dialogue are taken for granted. The analysis of dialogues is fundamentally concerned with understanding these complexities. Central to the concern for understanding the complexities of dialogues is the empirical issue of how interactants make sense of each other and the context in which they find themselves communicating. In other words, how does human conduct and behavior define communicative contexts, and how do communicative contexts shape the conduct and behavior of people? These questions are theoretically motivated by the work of Bakhtin (1986), who argued that (the utterances within) dialogues comprise a complex interplay between socially and historically established rules of conduct and behavior (i.e., what has been said in the past) and normative expectations co-constructed in situ (i.e., what is being said in the present). An analysis of dialogues begins with this understanding of spoken interaction, and is therefore different from other methodological approaches that adopt a narrower understanding of dialogues (cf. conversation analysis). Accordingly, dialogues are investigated by looking at three interdependent aspects of communication: organization, intersubjectivity, and social context. Organization encompasses the mechanics of spoken interaction (e.g., turn taking); intersubjectivity is related to how interactants jointly construct meaning; and social context deals with the sociocultural issues that influence, and are influenced by, dialogues. Each aspect of a dialogue will be discussed in this order.

Organization

Dialogues require all parties involved in communication to account for what has been said and what will be said. For instance, contributing to a dialogue requires taking into consideration previously said words or utterances, while at the same time speaking according to who is listening. When participants of dialogues account for what has been said and what will be said, they do so—for the most part—by taking turns. Researchers who

2 ANALYSIS OF DIALOGUE

use conversation analysis (CA) to examine dialogues have done the most in terms of investigating the organization of turn taking (e.g., Sacks, Schegloff, & Jefferson, 1974). CA researchers have demonstrated that turn taking is organized according to a basic, but integral and omnipresent interactional feature known as an adjacency pair (Schegloff, 2007). An adjacency pair consists of two parts: a first pair part and a second pair part. Each part represents a turn, spoken by a different speaker. A spoken turn minimally consists of a sound that performs an action (e.g., “oh” and “ah ha”), and maximally comprises many utterances. A classic adjacency pair is a question–answer exchange.

- (1) Speaker A: How old are you? (*Question*)
Speaker B: I’m twenty-nine (*Answer*)

The question in the above dialogue represents the first pair part of the adjacency pair, while the answer corresponds to the second pair part. It should be noted, however, that the name “adjacency pairs” is slightly misleading, as first and second pair parts need not be adjacently placed.

- (2) Speaker A: How old are you? (*Question 1*)
Speaker B: How old are YOU? (*Question 2*)
Speaker A: Thirty-two (*Answer 2*)
Speaker B: Twenty-nine (*Answer 1*)

Examples 1 and 2 demonstrate that adjacency pairs play an important structural role in dialogues by linking turns together. By taking a turn at talk, a speaker creates a set of conditions for the next turn, but at the same time reveals how the previous turn has been interpreted. In other words, any given turn in a dialogue is conditionally relevant to preceding and subsequent turns. Conditional relevance is a defining feature of dialogues, as put forward in Bakhtin’s (1986) conceptualization of social interaction.

Turn taking is also organized according to how one speaker makes the transition to the next. Turn transitions are accomplished in two ways: current speaker selects next speaker or next speaker nominates self (Sacks et al., 1974). Current speaker can select next speaker by, for example, asking a question (see examples 1 and 2), while self-nomination requires the next speaker to interject with a word or utterance. Most research done on turn transitions have used the concept “transition relevant place” (TRP) to understand how dialogues are organized (Sacks et al., 1974). One significant finding in the literature regarding turn transitions is that it is not uncommon for TRPs to occur in overlap (Schegloff, 2000). In other words, overlapping talk is a relatively common phenomenon in dialogues. This is because next speakers speak when provided with sufficient information in the prior turn to take part in the dialogue, and this need not occur at the end of a syntactically complete utterance.

- (3) Speaker A: Would you [like to join me?
Speaker B: [Yes, I would love to.

In the above exchange, speaker B has projected the content of the question, and therefore responds to speaker A’s invitation in mid-utterance—as indicted with the open brackets. That is to say, the TRP occurs in mid-utterance of speaker A’s turn because speaker B has enough information to provide an answer. Examining the sequential location of TRPs can assist in understanding other dialogic issues, for example, whether overlapping talk is considered an interruption (Schegloff, 2000), interlocutors’ social relationships (Erickson, 2004), and the institutional nature of talk (Drew & Heritage, 1992).

When taking turns in dialogues with two interactants, the general rule of thumb is that one person speaks at a time (Sacks et al., 1974). For example, when overlapping talk occurs in dyadic dialogues, at least one interactant will stop speaking to let the other continue (see example 3). However, in multiparty dialogues, it is not uncommon for two or more interactants to speak at the same, and for sustained periods of, time (Edelsky, 1981). When analyzing communication with three or more interactants, it is useful to think of dialogues as being organized by conversational floors. A conversational floor (or simply floor) is a larger organizational feature than a turn. Specifically, a floor comprises many turns; these turns contribute to the ongoing development of talk. Therefore, a floor can be characterized as having a thematic or functional direction (Jenks, 2007). For example, a floor can be related to the talk of negotiating a business deal or the teaching of a lesson. Examining dialogues at the floor level has revealed that a turn can be collaboratively constructed, and despite the work of conversation analysts, the direction of a floor need not develop in a linear, one-speaker-per-turn fashion (Hayashi, 1991). In fact, in multiparty dialogues—especially in situations where four or more interactants are present—it is not uncommon for one conversational floor to morph into two or more. This transformational phenomenon is often referred to as a conversational schism (Egbert, 1997). In conversational schisms, many interactants take turns at the same time whilst contributing to different floors, a situation that is even more common in text-based computer-mediated dialogues (Herring, 1999).

Intersubjectivity

In addition to uncovering the organization of spoken interaction, researchers have long been interested in examining how intersubjectivity is achieved in dialogues. That is, how do interactants make sense of each other's turns and floor contributions? Broadly speaking, there are two domains of inquiry regarding the process in which interactants co-construct meaning: resolving troubles and maintaining understanding.

The first domain of inquiry—that is, examining how interactants resolve troubles in dialogues—requires researchers to first identify where the trouble source is. A trouble is an umbrella term that covers all problems, mistakes, slips of the tongue, tips of the tongue, and mishearings that may occur in dialogues. For example, in example 4, speaker B requests for clarification, and as a result, treats speaker A's previous turn as the source of trouble.

- (4) Speaker A: I goed to the zoo.
 Speaker B: Huh?
 Speaker A: I went to the zoo.

Knowing where the trouble source is allows dialogue researchers to investigate many interactional issues. First, researchers can identify the sequential organization in which intersubjectivity is achieved. For example, in example 4, it takes two turns for speaker A to repair the trouble source: speaker B requests for clarification and speaker A repairs the trouble source. Second, it is also possible to identify that a speaker other than the one responsible for the trouble source initiates a request for clarification, and that the speaker of the trouble source is the interactant who corrects the trouble (Schegloff, Jefferson, & Sacks, 1977). Third, the work of linguistic anthropologists and discursive psychologists has shown that the sequential organization of dealing with troubles in communication provides an analytic window into social issues (Edwards & Potter, 1992). That is, how interactants deal with troubles reveals important information regarding the social roles and relationships of the interactants: whether, for example, an institutional role requires

an interactant to overtly correct mistakes in communication, as is the case in many classrooms (see Seedhouse, 2004). For instance, in example 4, speaker B could be a teacher responding to a student's grammatical mistake. Fourth, researchers can examine how interactants account for troubles in communication. For example, speaker B requests clarification, but does not specifically identify where the trouble source is within speaker A's turn. As a result, an analyst can see that while speaker B does not specifically identify the trouble within the previous turn, speaker A interprets the request for clarification as a signal that something is problematic in the conjugated verb.

The second domain of inquiry—that is, examining how interactants achieve intersubjectivity when there are no apparent problems in communication—entails taking the analytic focus away from investigating trouble sources. One way of doing this is to examine how utterances are designed to enhance comprehensibility. In dialogues, both the speaker and listener can design their talk and interaction in order to enhance comprehensibility. In most communicative situations, speakers are in a perpetual state of designing their talk according to the intended audience (Goodwin, 1979). This occurs at the most fundamental level of communication when a speaker uses the language of the recipient. At a more complex, microinteractional level, speakers design their talk in order to maintain meaningful communication. Speakers can speed up or slow down their speech (Miller, Grosjean, & Lomanto, 1984), carefully select or avoid words with special meaning (Stokoe & Edwards, 2007), strategically place stress and intonation (Couper-Kuhlen & Selting, 1996), and raise or lower voice amplitude (Selting, 1994)—to name a few.

Listeners can also design their utterances in order to enhance comprehensibility in dialogues. Verbally, listeners do this by providing feedback while another interactant is speaking. These feedback cues usually come in the form of minimal verbalizations. For example, an “okay” or “mmhm” may signal to the speaker that an utterance has been understood, and at the same time serve the function of active listening (Yngve, 1970). In addition to signaling understanding, these minimal verbalizations also serve the interactional function of letting an interactant know whether or not he or she should continue speaking (Young & Lee, 2004). Therefore, listeners enhance comprehensibility in dialogues at the content level—by displaying understanding (or nonunderstanding)—and at the interactional level—by taking part in the management of turns and floor contributions.

Social Context

The way interactants organize their turns at talk and maintain understanding in dialogues reflects the larger social context in which communication takes place. Social context is important to the analysis of dialogues because communication is fundamentally about people, and the real-life situations people are faced with (Malinowski, 1923). Aspects of social context include anything from the physical settings of dialogue—for example, a hospital or dining room—to the institutional roles and social status of the interactants—for instance, the relationship between doctor and patient or mother and daughter. Aspects of social context shape dialogues in many ways. The physical setting of a dialogue may compel interactants to communicate in a particular manner. For example, being in the confines of a library may oblige interactants to talk quietly, while speaking with increased voice amplitude is more socially acceptable at cocktail parties. Moreover, institutional roles sometimes dictate the flow of information in dialogues. For instance, a judge determines what is said and when it is said during courtroom deliberations. In a similar vein, a moderator during a televised debate allocates turns and organizes the dialogue according to a list of predetermined topics. Many more examples can be given, but the upshot is that everything said and done in dialogues is analyzable in terms of its sociocultural significance. This is true at the most micro levels of dialogue. So, for example, an interactant can

refer to herself or himself as “we”—instead of “I”—to bring authority to what is being said, as in “We do not accept your opinion,” as opposed to “I do not accept your opinion.” In a different social context, a “we” can be used to displace blame, as in “We have made the wrong decision,” as opposed to “I have made the wrong decision.” Accordingly, dialogues—including the meanings and functions of language—are intimately connected to social context. The idea that language is both a product of, and catalyst for, social context can be extended to psychological states. The work of discursive psychologists, for example, has shown that a psychological or cognitive state (e.g., anger or recalling an experience) is constituted in and through the moment-by-moment exigencies of dialogic exchange, and reflects the normative actions and activities of a given social context (see Edwards & Potter, 1992).

The methodologies used to understand the relationship between dialogue and social context can be categorized into two domains of inquiry: a priori and data-driven approaches. In a priori approaches, the researcher identifies what aspects of social context are important to the analysis of dialogue. For example, if an interactant comes from a particular geographical location, say Korea, then the researcher will use this identity to inform the analysis of dialogue. That is to say, the dialogue is investigated with the (a priori) understanding that the identity of being Korean is omnirelevant for the interactant(s). Methodologies that are associated with a priori approaches include critical discourse analysis and social psychology. In data-driven approaches, being Korean is relevant if the researcher can show—in and through the talk and interaction—that the interactant orients to this identity during the ongoing management of dialogue. In other words, Korean is only one of many social categories that an interactant belongs to (e.g., male/female, teacher/student, husband/wife, Asian/non-Asian). Accordingly, data-driven approaches require researchers to show how any given social category is relevant to the local, situated practices of participating in a dialogue. Methodologies that are associated with data-driven approaches include, but are not limited to, discursive psychology and conversation analysis.

Conclusion

The analysis of dialogue comprises three intersecting themes: organization, intersubjectivity, and social context. An examination of one theme often requires an understanding of the other two. This is because despite possessing a complex, internal structure for which interaction and meaning are managed, dialogues are situated in the real-life experiences of people. The analysis of dialogue aims to understand this complex interplay between interactional structure and social reality. While investigating the organization of talk and interaction is a discipline in its own right, no examination of spoken interaction is fully complete without an understanding of how people fit into the, as it were, dialogic equation.

Analysis of Discourse and Interaction: Overview

RODNEY H. JONES

When we speak of the study of discourse and interaction, we are mostly concerned with the analysis of synchronous conversation as opposed to written texts, although we might also consider text-based computer-mediated communication. This is not to say that writing is not interactive: people write letters to each other and, more recently, engage in asynchronous written interaction through blogs and social networking sites. The focus of the analysis of discourse and interaction, however, has traditionally been on “real-time” interaction in which participants are temporally copresent (though they may be spatially distant) and jointly engaged in some kind of social action. Examples include face-to-face interactions of various kinds (from religious rituals to casual conversations), telephone conversations, video conferences, chat and instant messaging sessions, and the interaction between avatars in online games or in virtual worlds. Discourse analysts are chiefly concerned with how parties in interaction work together to construct their social identities, their social relationships and their social realities moment by moment through language.

Historical Overview and Major Influences

Apart from linguistics, the study of discourse and interaction has been influenced by work in numerous fields including philosophy, anthropology, and sociology. In philosophy it traces its intellectual roots to the work of Ludwig Wittgenstein who helped to move the philosophical study of language away from earlier rule-based approaches towards a focus on how people actually employ words and sentences in concrete situations. In *Philosophical Investigations* (Wittgenstein, 1958) he argued that, rather than merely being a vehicle for naming things and conveying information, language is an *activity* or “form of life” in its own right. Wittgenstein’s emphasis on the role of language in the enactment of social life was a major inspiration for British and American “philosophers of ordinary language” like John Austin (1962) and John Searle (1969) whose speech act theory, along with the work of Paul Grice (1975) on implicature, became the foundation for the development of the field of pragmatics (see PRAGMATICS IN THE ANALYSIS OF DISCOURSE AND INTERACTION).

In anthropology the study of discourse and interaction has been influenced by the work of Bronislaw Malinowski, who was one of the first to acknowledge the importance of social and cultural context in interpreting linguistic behavior, as well as by the symbolic interactionism of George Herbert Mead, who argued that meaning essentially arises out of social interaction among members of a particular culture. The most profound influence, however, has come from Dell Hymes (1974), who, in the 1960s, at the height of Chomsky’s influence on American linguistics, argued that the proper object of the social scientific investigation of language should not be linguistic forms but rather how people actually use language to interact in culturally specific “speech events.” His notion of *communicative competence*, the ability not just to speak a language but also to *interact* in that language in particular situations provides an alternative to Chomsky’s more abstract idea of linguistic

2 ANALYSIS OF DISCOURSE AND INTERACTION: OVERVIEW

competence. Hymes's most significant contribution was an outline for collecting, categorizing, and analyzing the components of social interactions he referred to as the ethnography of communication (see *ETHNOGRAPHY OF COMMUNICATION AS A RESEARCH PERSPECTIVE*), an outline which is still widely used by anthropologists, communications scholars, and discourse analysts.

The contribution to the study of discourse and interaction from sociology comes from two fronts. One is ethnomethodology, an approach to the study of social life developed by the American sociologist Harold Garfinkel (1967), which concerns itself with the ways people generate order in their social lives based on shared expectations about the procedures for accomplishing everyday activities (see *ETHNOMETHODOLOGY IN THE ANALYSIS OF DISCOURSE AND INTERACTION*). This preoccupation with the procedural nature of everyday life became the basis for the development of *conversation analysis* (Sacks, Schegloff, & Jefferson, 1974), an approach to discourse and interaction which focuses on how participants create order through the sequential organization of talk. This approach also resonates strongly with Wittgenstein's interest in mapping the orderly linguistic practices of actual language users.

The second influence on the study of discourse and interaction from sociology comes from the work of Erving Goffman, whose dramaturgical approach to social life highlights the nature of talk as a means of self-presentation. For Goffman, social interaction is like a play in which participants simultaneously cooperate in helping one another maintain convincing performances and compete with one another in advancing their particular "lines" or versions of "what's going on." The key ideas Goffman contributed to the study of social interaction are the concepts of "face" (Goffman, 1959)—the negotiated public image people grant to each other in interaction—and "frames" (Goffman, 1974)—the way people strategically organize, communicate or conceal what they are doing when they interact (see *FRAME ANALYSIS*). These two concepts form the basis for much of the analytical work in *INTERACTIONAL SOCIOLINGUISTICS AS A RESEARCH PERSPECTIVE*. Goffman also called into question traditional dyadic notions of social interaction, pointing out that people participate in many different kinds of interactions from dyadic conversations to large-scale platform events and take up many different kinds of interactional roles from ratified participants to bystanders (Goffman, 1981) (see *PARTICIPATION FRAMEWORKS AND PRODUCTION FORMATS IN THE ANALYSIS OF DISCOURSE AND INTERACTION*). Analysts of interaction, he argued, must seek to understand how participants align themselves to their utterances and to the people with whom they are interacting, alignments that are dynamically negotiated in the course of ongoing encounters. In this way, Goffman not only defied the traditional notions of language advanced by structural linguistics, but also challenged the traditional definitions of social roles used in structural sociology. More recently, social psychologist Rom Harré and his colleagues (Harré & Van Langenhove, 1999) have built upon and revised many of Goffman's ideas with their theory of *POSITIONING IN THE ANALYSIS OF DISCOURSE AND INTERACTION*, an analytical approach which goes even further than Goffman in considering the contingent and dynamic nature of social roles in interaction.

Major Concerns

Although analysts of discourse and interaction approach their object of inquiry from a variety of different traditions, there are a number of concerns common to almost all of them. The first is the fundamentally dialogic nature of all interaction (see *ANALYSIS OF DIALOGUE*). Interaction is, by definition, a cooperative endeavor, and the way participants conduct themselves and what they are able to accomplish depends upon the conduct of other participants in the interaction. This dialogicality, however, goes beyond the boundaries of conversations; in a sense, conversations also occur in response to previous

conversations and in dialogue with larger cultural conventions, traditions, and ideological formations.

Another central issue in the analysis of discourse in interaction is how people express meanings and accomplish social actions through language. Even a cursory analysis of everyday interaction reveals that the answer to this question is neither easy nor straightforward. Often people do not say what they mean or mean what they say. A large proportion of the meanings and intentions of participants in social encounters are communicated indirectly (through implicature) and subject to multiple interpretations by hearers (through inference). The problem of INFERENCE AND IMPLICATURE is approached differently by different analytical traditions. Pragmatics and ethnography consider how interactants refer to conditions surrounding utterances, including the identities and intentions of speakers, in order to make sense of them, whereas traditions more focused on the microanalysis of talk focus on how people make use of the structural aspects of conversation itself to produce and interpret meanings.

One of the most important debates in the analysis of discourse and interaction concerns the role of context (see CONTEXT IN THE ANALYSIS OF DISCOURSE AND INTERACTION). The debate is not so much whether or not context is important in the analysis of interaction, but rather what should be counted as context. At one extreme, conversation analysts limit their definition of context only to those aspects of the situation made immediately relevant in the talk itself, and at the other extreme, those employing the ethnography of communication and critical discourse analysts tend to take a wider view of context to include broader sets of cultural beliefs and ideological formations within societies.

Another important preoccupation for analysts of discourse and interaction has to do with the way linguistic interaction functions as a site for the production and reproduction of social, cultural, institutional, and organizational identities (see ANALYSIS OF IDENTITY IN INTERACTION). This includes both how particular kinds of social identities are claimed, imputed, performed, and negotiated through interaction (see, for example, ANALYSIS OF GENDER IN INTERACTION and POLITENESS AND FACE RESEARCH), and the role of different speech genres in helping interactants accomplish such performances (see, for example, ANALYSIS OF NARRATIVE IN INTERACTION).

Although most studies of language in interaction take a social rather than a psychological perspective, preferring to focus on discourse rather than make conjectures about mental processes, there is a growing interest in linguistic interaction by cognitive linguists, and a growing interest in cognitive processes by scholars in such fields as pragmatics and conversation analysis (see COGNITIVE MODELS OF INTERACTION).

Many of the interactions discourse analysts study are not face-to-face conversations of the traditional sort, but rather interactions that are mediated through some form of technology such as telephones, computers, or, more recently, mobile digital devices. In fact, the earliest studies in conversation analysis used as their data telephone conversations. The ANALYSIS OF MEDIATED INTERACTION demands that the analyst take into account the ways the medium of communication defines and constrains many of the aspects of interaction discussed above, including the resources available for making meaning and negotiating identity, and the role and definition of context in the interaction.

Finally, there is an increasing awareness among discourse analysts that verbal interaction is never *just* verbal, that interactants deploy a variety of different modes to communicate meanings and manage interactions including rhythm and timing (see RHYTHM AND TIMING IN INTERACTION), silence (see ANALYSIS OF SILENCE IN INTERACTION), and a whole host of visual modes like gesture, posture, gaze, dress, and architectural layout. This awareness has had a profound effect on the way many traditional perspectives on discourse such as conversation analysis and interactional sociolinguistics conduct their analysis, and has also given rise to new perspectives on discourse such as MULTIMODAL INTERACTION ANALYSIS.

Research Methods

Analysts of verbal interaction have used a variety of types of data ranging from naturally occurring conversations to talk elicited in controlled situations. Naturally occurring data, however, is generally seen as the most reliable form of data, and with advances in audio recording over the past fifty years, it has become easier to collect and accurately transcribe.

The reliance on recordings of naturally occurring data, however, has brought with it its own set of dilemmas and debates. One has to do with how naturally occurring data is to be defined, particularly given the fact that as soon as one introduces a recording apparatus into an interaction, it ceases to be “natural.” The second has to do with how recorded data is best represented in written form. A whole host of different methods of transcribing interactions have been developed over the years, each reflecting the particular theoretical priorities and limitations of the analyst who uses it. Digital video and computer technology, especially tools for examining large corpora of data, have introduced even more sophisticated ways of capturing, representing, and analyzing interactions.

The most important concerns arising from such technological advances, however, are ethical ones. ETHICAL DEBATES IN RESEARCH ON LANGUAGE AND INTERACTION have focused not just on issues of privacy and informed consent around the collection of data and the reporting of findings, but also on more fundamental questions about the purpose of social scientific research and the responsibilities researchers have towards the people they study.

Analysis of Gender in Interaction

JENNIFER M. WEI

What Is Gender in Human Interaction?

Our conventional idea of gender can be seen from three major perspectives: biological, social, and cultural. That is, we are born with a set of genes that determine our biological sex—either male or female in most of the clear-cut cases. A male brain is larger than that of a female but that does not make much difference to its overall capacity. Men are also said to be more visual and spatially oriented while women are more audio and emotionally oriented. According to a recent study based on a large corpus of English, the researchers Newman, Groom, Handelman, and Peenebaker (2008, p. 211) found that “Women used more words related to psychological and social processes. Men referred more to object properties and impersonal topics.” It can be said also that society sets gendered expectations or gendered roles for boys and girls, men and women, and husbands and wives, roles that we internalize and with which we socialize as we go through schooling, working, and living in a certain society. We learn that, in most societies, women are thought to be cooperative and family-oriented while men seem more aggressive, competitive, and career-oriented. Gender also plays a role culturally as different cultures and the weight of different histories can influence how certain gender traits, especially notions of masculinity and femininity, will interact in our lives.

Seeing gender or gendered behaviors and expectations as embedded in contexts, histories, and cultures helps us remain aware of the dynamics and indeterminacy of this topic. The conventional idea of seeing gender as a fixed and dichotomized category prescribed by a set of patriarchal values might still have strong meaning for some people, allowing their manipulation to advance a political agenda in some contested contexts, but it has been challenged by scholars in fields of applied linguistics and discourse analysis. That is, as individuals we do retain some agency in enacting and negotiating gendered roles and expectations in our mundane interactions with others. Not all of the interactions have a gendered dimension, of course; nor do our actions and intentions necessarily bring us the expected results. Linguists and scholars involved in discourse analyses are interested in how language can interact with these gendered performances, though other variables—such as the clothing we wear and nonverbal behavior—can also facilitate or debase such interaction. Such gendered “acts of identity” are more or less like other social identities subject to a variety of variables such as age, ethnicity, ideology, social status, and so forth.

A particular society might change its ideals about gendered roles, such as being a good mother and father or a filial son and daughter, as it evolves from a traditional society to a modern one. In fact we have seen this in most of the more developed countries, where birth rates have decreased as people no longer see traditional familial rituals such as marriage and giving birth as necessary rites of passage. Nor do individuals in these countries necessarily turn to traditional family and family members as their main or only sources of emotional and financial backup and support in times of trouble. With old familial values being replaced by more global and modern enthusiasms such as consumerism and individualism, customs associated with gendered expectations are also changing.

2 ANALYSIS OF GENDER IN INTERACTION

Different cultures also modify their ideals of a gendered trait—masculinity and femininity to start with—through time. These ideals are not always in harmony with each other, nor do they stay in fixed contrast to each other. One example of how a culture can change its ideas or ideals for developing men as men and women as women comes from Chinese culture as observed by Brownell and Wasserstrom (2002, p. 34). According to the authors,

Scholarship on Chinese gender seems to indicate that, before the period of extended contact with the West, (1) gender concepts were anchored in beliefs about family structure and social roles more so than in beliefs about biological sex (and even beliefs that we might call “biological” were based on classical Chinese medicine, not Western science); (2) “men” and “women” were plural categories rather than unified categories opposed to each other; (3) “manhood” and “womanhood” were not directly linked to heterosexuality, and reproducing the lineage was a more important aspect of sexuality than individual pleasure.

Did contact with the West bring changes? Are any of the gendered traits more susceptible to change while others are more resistant? Did other forces such as modernization or nationalism reinforce or relativize Chinese ways of thinking and enacting gendered relations? Again, the authors conclude that

Chinese gender maintained its own distinctive character—in particular, sexuality did not occupy the central role that it does in Western gender. Sexuality seems to have regained importance in the 1990s, but concepts of femininity and masculinity still seem to be primarily anchored in the roles of mother/father and wife/husband. The main change since the Qing is that femininity and masculinity are less anchored in the roles of daughter/son. (2002, p. 34)

In this entry, we will examine how language can play a role in various gendered interactions by referring to lived experiences from various cultures and societies (as opposed to representations or artifacts). We take our data and analyses mainly from the field of variational sociolinguistics, discourse analyses, and cultural studies. All of these disciplines stress the importance of interdisciplinary studies on how language can be used and analyzed to understand gendered interactions in a specific context. This does not mean that a specific linguistic item—a phonological variable, a lexical choice, or syntactic feature—has determining effects for how gender can be enacted in a specific interaction. Instead, precisely because gender is embedded in a complex web of communicative interaction, a specific use of language rarely yields clear-cut pragmatic or strategic effects. Polysemy and indeterminacy must be dealt with, and they thrive not only in how an individual can or will interpret an interaction but also in how they tie in with other social variables such as power or ethnicity, which are seen differently in various cultures.

The Polysemy of Gendered Language

Much scholarly time has been spent arguing that discussions of gender should be located within particular communities of practice (Eckert & McConnell, 1992). That is, by studying gender in interaction and studying the local meanings attached to interactions, within and among communities, a more flexible understanding of gender can be developed—an understanding that allows for variability of meaning and dimensions. Researchers on language do not always agree on whether gender is the only determining factor for how and why men and women speak differently; some argue that power and domination might be better descriptors for difference. That is, women adopt a more subversive way of

speaking to reflect their subordinate position (mostly true socioeconomically) in a society. Other researchers suggest that the same gendered language can be adopted by either sex for strategic and political purposes. For instance, Lakoff (1990) observes that numerous traits have been said to characterize women's forms of speech in American culture, but not all women use them, and probably no one uses them all the time. (They are, for instance, more likely to show up in informal social settings rather than in business situations.) Men sometimes use "women's forms of speech" either with different meanings or for individual special reasons. In the following section, we will list observations by Lakoff as background to compare with other instances where a similar language use adopted in a different social context yields different meanings. The section will end with examples of men using similar gendered language for strategic and commercial purposes.

First, Lakoff provides the following characteristics (1990, p. 204):

1. Women often seem to hit phonetic points less precisely than men: lisped *s*'s, obscured vowels.
2. Women's intonational contours display more variety than men's.
3. Women use diminutives and euphemisms more than men ("You nickname God's creatures," says Hamlet to Ophelia).
4. More than men, women make use of expressive forms (adjectives, not nouns or verbs, and in that category those expressing emotional rather than intellectual evaluation): *lovely, divine*.
5. Women use forms that convey impreciseness: *so, such*.
6. Women use hedges of all kinds more than men.
7. Women use intonation patterns that resemble questions, indicating uncertainty or need for approval.
8. Women's voices are breathier than men's.
9. Women are more indirect and polite than men.
10. Women will not commit themselves to an opinion.
11. In conversation, women are more likely to be interrupted, less likely to introduce successful topics.
12. Women's communicative style tends to be collaborative rather than competitive.
13. More of women's communication is expressed nonverbally (by gesture and intonation) than men's.
14. Women are more careful to be "correct" when they speak, using better grammar and fewer colloquialisms than men.

The interactional aspect of "gendered" talk can be found in the ideas of Eckert and McConnell (2003) about positioning, and in those of Tannen (1990) on rapport versus rapport (i.e., women tend to use conversation to establish intimacy and relationships, while men use it to provide information and to seek independence and status). In addition to social practices, positioning, and styles, researchers such as Gal (1991) have suggested that we should not be accounting for these linguistic differences from a one-dimensional gender factor. She uses silence as an example to encompass the complexity of how the meanings of "powerless" can be changed when silence is used in a different context at different times. For example,

The silence of women in public life in the West is generally deplored by feminists. It is taken to be a result and symbol of passivity and powerlessness; those who are denied speech, it is said, cannot influence the course of their lives or of history. In a telling contrast, however, we also have ethnographic reports of the paradoxical power of silence, especially in certain institutional settings. In episodes as varied as religious confession,

4 ANALYSIS OF GENDER IN INTERACTION

exercises in modern psychotherapy, bureaucratic interviews, oral exams, and police interrogations, the relations of coercion are reversed: where self-exposure is required, it is the silent listener who judges and thereby exerts power over the one who speaks (Foucault 1979). Silence in American households is often a weapon of masculine power (Sattel 1983). But silence can also be a strategic defense against the powerful, as when Western Apache men use it to baffle, disconcert, and exclude white outsiders (Basso 1979). And this does not exhaust the meanings of silence. For the English Quakers of the seventeenth century, both women and men, the refusal to speak when others expected them to marked an ideological commitment (Bauman 1983). It was the opposite of passivity, indeed a form of political protest. (Gal, 1991, p. 175)

The interactional aspect of “gendered” talk as exemplified by the above example helps us see that the use of “silence” is not a direct index of femininity, but rather represents a kind of stance (subject position) that is taken up by (or imposed on) a variety of less powerful people in society, including, but not limited to, women (see Jaffe, 2009, p. 13). The stress on agency, context, and ideology is very important in understanding how gender is embedded in language variation and social practice. Another intergender and intragender language use is provided by Bucholtz (2009), who analyzes a single slang term popular among many Mexicans and Mexican Americans—*guey* ([gweɪ], often lenited to [weɪ])—and argues that, though the term frequently translates as “dude,” the semantic multivalence of *guey* allows it to operate (often simultaneously) as a marker both of interactional alignment and of a particular gendered style among Mexican American youth (p. 146). That is, her subjects do not use *guey* because they are male, nor do they use *guey* in order to directly construct a masculine identity. Rather, they are using this term along with other available semiotic resources, such as prosody, gesture, posture, clothing, topics of discourse, and telephones and cameras to establish both status and solidarity in relation to their social group and to index a cool, nonchalant stance all the while (see Bucholtz, 2009, p. 164).

Other scholars, such as Hall and Bucholtz (1995, pp. 183–4), link gendered language to different factors such as the speaker’s agency, age, educational background, and ethnicity, and—to the perennial fascination of college students—have even interpreted meanings of gendered language through the prism of the phone sex industry in San Francisco. Hall argues that:

This high-tech mode of linguistic exchange complicates traditional notions of power in language, because the women working within the industry consciously produce a language stereotypically associated with women’s powerlessness in order to gain economic power and social flexibility.

She further argues that:

The very existence of the term *sweet talk*—an activity that, in the American heterosexual mainstream, has become associated more with the speech patterns of women than those of men—underscores the ideological connection between women’s language and sexual language.

In response to economic incentives and requests to reinforce stereotypical gendered images, phone sex workers (both men and women) are exploiting gendered language for their own economic survival. They come from all walks of life, different ethnicities and age groups, and are trying to make a living (and make fun) of the gendered language. They do not naively or passively speak in a language reflecting their subordinate status. Instead, they actively seek out ways to profit from their clientele’s lack of imagination by exploiting gendered language.

Indirectness is another common example which should alert us to indeterminacy when we see language used in such a way as to enact gender relations in different contexts. For example, Tannen (1994) finds that both Greek men and Greek women are likely to interpret a question as an indirect request whereas American women are more likely than American men to make such an interpretation. Keenan (1974) finds that, in a Malagasy-speaking village on the island of Madagascar, men use more indirect language while women are more direct, but this does not mean that women have the dominant role in that society. These examples inform us again of the importance of seeing gender in interaction with a specific community practice. Indirectness, then, according to Tannen (1994, p. 34), can be used either by the powerful or by the powerless; the interpretation of a given utterance, and the likely response to it, depends on the setting, on an individual's status, and on the relationship of individuals to each other, as well as on the linguistic conventions that are ritualized in the cultural context.

We will end this section with an example of men adopting women's language for strategic purposes. As Holmes (1992, p. 317) observes, researchers recorded the speech of witnesses in a law court and found that male witnesses used more women's language features than women witnesses with more expertise in court or a higher occupational status. The following example illustrates this.

Lawyer: And you saw, you observed what?

Witness C: Well, after I heard—I can't really, I can't definitely state whether the brakes or the lights came first, but I rotated my head slightly to the right, and looked directly behind Mr. Z, and I saw reflections of lights, and uh, very very instantaneously after that I heard a very, very loud explosion—from my standpoint of view it would have been an implosion because everything was forced outward like this, like a grenade thrown into the room. And uh, it was, it was terrifically loud.

In this exchange, the male witness used "women's" language—hedges and boosters—in his account of what happened. Sex (i.e., being a man or a woman) was not a determining factor for this kind of gendered language use. Instead, it was used to enact the "powerless" role of the witness (who is not a woman in this case) in his interaction with the lawyer or in his recounting of what had happened, and may even have other pragmatic effects, such as avoiding accountability or responsibilities and thus expecting leniency or acquittal.

To conclude, gender is a complex social concept embedded in our biological wiring and socialization, as well as in mundane and professional interactions with others. Language can either reflect and reinforce a conventional gendered relationship or subvert stereotypical gendered images, as we see in the sweet talk performed by both men and women in high-tech phone sex industries in San Francisco, or in men's adoption of women's language for courtroom interactions for strategic purposes.

Analysis of Identity in Interaction

CYNTHIA GORDON

Introduction

The relationship between language and identity has long been a topic of interest in linguistics. In recent years, research on identity “has become increasingly central” (Bucholtz & Hall, 2005, p. 585) to studies of interaction. Yet “identity” remains an ambiguous term. Identity is multifaceted; it can be described from biological, psychological, cultural, and social perspectives (Carbaugh, 1996). The term “refers to core aspects of selfhood” (Tracy, 2002, p. 17) that are presumed to be stable and fixed; identity is thus something a person has or possesses. Identity is also a fluid ongoing accomplishment (e.g., Tracy, 2002), performance (e.g., Carbaugh, 1996), or achievement and tool to be used in interaction (e.g., Antaki & Widdicombe, 1998). Thus Tracy (2002) observes that the language–identity link is studied from two primary perspectives: the *cultural perspective*, which examines how an individual’s preexisting identity influences how he or she uses language in interaction, and the *rhetorical perspective*, which focuses on how an individual uses language to construct identities in interaction. These perspectives facilitate investigations of a range of identities: those that are related to broad social categories (like “woman”), to relationships (like “mother”), to specific interactions (like “leader of workplace meeting”), and to the personality traits and opinions that people manifest at particular conversational moments (see Tracy, 2002, chap. 1).

Studies of identity in interaction are methodologically and theoretically diverse. This entry gives an overview of two approaches that have contributed substantially to understanding the complex relationship between who we are and how we communicate: sociolinguistic variation analysis and discourse analysis. Sociolinguistic variation uses primarily quantitative methods to explore language diversity and its relationship to social identity. Discourse analysis is a collection of approaches, including interactional sociolinguistics, conversation analysis, and discursive psychology, to qualitatively explore language in context, including how language use is related to participants’ identities. Studies within each of these paradigms that draw on the cultural perspective or the rhetorical perspective (or both) give insights into identity as a somewhat stable, somewhat fluid entity that shapes—but is also shaped by—language use.

The Cultural Perspective: Identity Shapes Discourse

There is much research that investigates how a person’s identity—what a person’s basic category memberships are, for example—influences how she or he speaks, leading to important insights into language diversity and interactional patterns.

The Cultural Perspective in Variationist Sociolinguistics

Quantitative variationist sociolinguistics investigates linguistic diversity as patterned with various aspects of identity; it thus demonstrates how social category membership affects use of language. As Schilling-Estes (2004, pp. 163–4) explains, the approach traditionally

2 ANALYSIS OF IDENTITY IN INTERACTION

focuses on “establishing correlations between aggregate patterns of language use and social categories” such as sex, race, age, class, and ethnicity, that have, for the purposes of analysis at least, “been taken to be relatively fixed.” These facets of identity are shown to be patterned with language variation, including uses of phonological, lexical, and morphosyntactic variables. The cultural perspective in variationist sociolinguistics offers insights into why language diversity exists and its relationships to identity; although the focus is not on interaction per se, it lays a foundation for subsequent research in the area.

The Cultural Perspective in Discourse Analysis

Some research in discourse analysis, especially that conducted in the 1980s and 1990s in interactional sociolinguistics, focuses on how speakers’ identities influence their discourse in interaction. A basic premise underlying interactional sociolinguistics is that language is a social and cultural phenomenon; thus people from different cultural backgrounds (in other words, with different cultural identities) tend to use (and interpret) language differently. Understanding these differences not only gives insights into how communication works and an explanation for why miscommunication occurs, but also highlights culturally patterned ways of speaking. Naturally occurring interactions constitute the primary data for this body of research, though these are often contextualized by ethnographic observation and interviewing; this approach thus complements quantitative studies.

For example, Gumperz (1982, chap. 8) suggests that feelings of ill will he documented between native Anglo-British baggage handlers at a major urban airport and the Indian and Pakistani women who served them lunch in the cafeteria resulted, in part, from different culturally shaped ways of speaking. In particular, different uses of pitch and other “contextualization cues” that signal how a speaker means what she or he says were found to be of importance. For instance, the women’s lack of rising intonation when offering a serving of food, like gravy, was perceived as rude to the baggage handlers, who expected a rising intonation; the women, however, were using intonation in ways that would be considered polite in their cultures. Thus, how one uses language, and interprets the language use of others, is linked to the cultural identity one possesses, in this case either Anglo-British or newly immigrated Indian or Pakistani.

Tannen (1986) also takes the perspective that identity influences how a person interacts; she suggests that “subcultural” differences, such as regional or gender differences, can lead to misunderstandings. Tannen links ways of speaking to certain relatively broad aspects of identity; for instance, she finds that New Yorkers, more so than Californians, use fast-paced personal questions as a means of being friendly when getting to know someone. Many Californians, however, interpret this strategy as aggressive. Tannen’s work suggests that sensitivity to a person’s social identity may increase understanding of the linguistic strategies she or he uses, and of unfolding conversational dynamics. Further, Tannen emphasizes that each individual has a unique style resulting from the interweaving of the many facets of their identity, including those investigated by sociolinguistic variationists (race, class, ethnicity, etc.).

By viewing identity as relatively stable and as shaping how people communicate, discourse analysts have linked ways of speaking to social group membership, and have thus provided explanations for differences in language use. Further, discourse analytic studies that take the perspective that identity shapes interaction have given insights into how and why miscommunication—and successful communication—occurs.

Summary: Identity Shapes Discourse

In sum, both quantitative sociolinguists and qualitative discourse analysts have taken what Tracy (2002) calls the cultural perspective in arguing that identity influences language use, be it at the level of a single variable (like pronunciation of a consonant) or a broader pattern

of interaction (like question asking). Such studies lend insights into language diversity, and isolate aspects of identity that potentially affect how one uses (and interprets) language, thus contributing to understanding people as social beings who carry their cultural experiences and identities with them as they communicate in their social worlds.

The Rhetorical Perspective: Discourse Shapes Identity

The idea that individuals create identities through language can be broadly described as a constructionist approach, one that treats self and identity as “a consequent of discursive and interactive life,” rather than as a given (Carbaugh, 1996, p. 6). Like the cultural perspective, this (rhetorical) perspective is represented in both variationist sociolinguistic and discourse analytic traditions.

The Rhetorical Perspective in Variationist Sociolinguistics

Linguistic flexibility has been of great interest to sociolinguists, especially in diverse, multilingual contexts. Variationist research has emphasized how speakers shift ways of speaking to create different identities at different interactional moments. As Le Page and Tabouret-Keller (1985, p. 181) remark, an individual speaker can alter his or her linguistic patterns to “resemble those of the group or groups with which from time to time he [or she] wishes to be identified, or so as to be unlike those from whom he [or she] wishes to be distinguished.” They conceptualize linguistic behavior as consisting of “a series of *acts of identity* in which people reveal both their personal identity and their search for social roles” (Le Page & Tabouret-Keller, 1985, p. 14). This means that people can adjust their language to join with others, a notion similar to accommodation theory (e.g., Giles, Coupland, & Coupland, 1991). Research on code switching and style shifting, for example, suggests that speakers switch between language varieties and styles to portray a range of identities, including those that are often thought of as “fixed,” like ethnic identities. Ethnographic methods, often accompanied by both quantitative and qualitative analyses of conversational extracts, are used within this thread of variation research.

Alim (2004), for example, explores language styles used by African American students at an ethnically and linguistically diverse California high school. He considers how students shift styles in ways related to various aspects of their identities. For instance, while third-person-singular -s absence (e.g., *he walk*, a form associated with African American English) can be explained by a speaker’s gender, hip-hop knowledge, and (most of all) race (Alim, 2004, p. 164), the students exhibited an immense “stylistic flexibility” (p. 200) in their speech. Alim suggests that this flexibility, rather than simply reflecting identities students possess, enables them to create multifaceted identities. Further, this flexibility is emblematic of an identity disconnect with (the predominantly White) teachers, who neither displayed this flexibility themselves, nor recognized it in their students, perhaps in part owing to a dominant institutional ideology favoring “Standard English” over what Alim refers to as “Black Language.”

Eckert and McConnell-Ginet (1995) provide another example of a contemporary sociolinguistic study that investigates identity as fluid. As they explain, people are “continually transforming identities, understandings, and worldviews” as they shift between “communities of practice” or groups of people who share mutual engagement and ways of doing and talking about things (Eckert & McConnell-Ginet, 1995, p. 469; for “community of practice,” see Lave & Wenger, 1991). Eckert and McConnell-Ginet’s research examines the negotiation of gender, socioeconomic class, and power in linguistic (and other) practices of students at a suburban Detroit high school. Analyzing interview data collected as part of ethnographic fieldwork, they uncover how students define themselves and others in relation to the school’s dominant social categories of *jocks* (students oriented to school

activities) and *burnouts* (students oriented toward the local working-class community and its values). Using quantitative methods, they find that students who participate in these two different communities of practice show distinctive uses of grammar, vocabulary, and pronunciation. However, there are also gender differences and variation within each group according to the individual's specialized identity. For example, "burned-out burnout girls" not only claimed they were different from "jocky burnout girls," but their phonology—their pronunciation of certain vowels in particular—helped them create a speech style that constructed a measure of distance or disaffiliation.

Similarly, Bucholtz (1999) investigates how a group of high-school "nerd girls" use language and other social practices to delineate their group and negotiate their individual places within it. Through linguistic choices at multiple levels of language structure, the girls disassociate themselves from non-nerds and construct the central component of a "nerd" identity, an "intelligent self" (Bucholtz, 1999, p. 212), for instance through using sophisticated vocabulary in casual conversation and collaboratively engaging in playful intellectual debate. Importantly, these linguistic practices are considered within the context of the social groupings present in the school, and the students' ideologies about who they are in relation to others. Their identities are not "given"; they are interactionally situated and jointly constructed and negotiated.

In summary, studies of sociolinguistic variation that view identities as rhetorically constructed contribute to understanding linguistic variation as not so much an outcome of category membership, but as a means of achieving membership—a way of creating an identity for one's self.

The Rhetorical Perspective in Discourse Analysis

As many contemporary studies in linguistic variation have adopted a rhetorical perspective on identity, so too has recent discourse analytic research. Discourse analyses of unfolding conversation reveal how interactants' identities are linguistically shifted moment by moment. This scholarship draws on a range of discourse analytic approaches, including interactional sociolinguistics, conversation analysis, and discursive psychology; this highlights the truly interdisciplinary nature of the contemporary study of identity within discourse analysis.

Widdicombe (1998) brings to bear the notion of membership categories to identity-work in interaction. Using conversation analysis and drawing on Sacks's (1992) theorizing, she observes that "categories are conventionally associated with activities, attributes, motives and so on" (Widdicombe, 1998, p. 53). Thus Widdicombe's (1998) analysis of the discursive establishment of membership to youth subculture categories like "punk" or "gothic" highlights strategies used by speakers as they resist (or accept) not only category membership, but also the "inferential consequences of characterizing oneself as a member" (p. 52).

Also examining the discourse of young people, Bailey (2002) explores identity negotiation among second-generation Dominican Americans who attend a multilingual, multiethnic high school in Providence, Rhode Island. His study integrates ethnographic observations and interviewing with discourse analysis of naturally occurring talk to provide insights into a situation where identity is very salient: In the context of the USA, Dominican Americans are often perceived as being Black or African American (based on skin tone and other aspects of physical appearance), which denies their Hispanic ethnicity as speakers of Spanish. Bailey finds that the students draw on different varieties of language to foreground particular ethnic and racial identities in different situations and to accomplish different goals. For instance, a male student uses Dominican Spanish to flirt with a Spanish-speaking female student, and her switch to English not only rebuffs him but also downplays their shared identities as Spanish speakers.

Hamilton (1996) contributes to understanding how identities are created moment to

moment in individual conversations, as well as how relatively stable identities (identities that emerge across conversations) are constructed. She analyzes interactions that occurred between herself and Elsie, an Alzheimer's patient. Hamilton (1996) observes that Elsie used language to portray herself as having a wide variety of identities, including mother, wife, adult, friend, and patient (p. 72); the analysis focuses on how peer versus patient identities are co-constructed and negotiated in interaction, especially through linguistic politeness strategies. Examining interactions separated by time but linked by repeated linguistic material, Hamilton also demonstrates how, as Elsie's condition declines, the language of both parties intertextually establishes for Elsie a relatively stable "patient" identity.

Goodwin (2006) also investigates the idea that identities are created both within and across interactions. She examines children's, and especially girls', playground language practices and how discourse and action are used to constitute children's social worlds and identities. This study is important because participants "come to inhabit particular and ever-shifting positions in the local social organization of situated activity systems through interactive work" (Goodwin, 2006, p. 3). Analyzing girls' participation in speech activities such as making assessments, for example, Goodwin demonstrates how individuals position themselves vis-à-vis others to create not only gendered identities, but also identities related to social class, knowledge, and authority.

Developing the literature on identity in interaction, and especially the discursive portrayal of gendered identities across contexts, Kendall (2003) investigates how one working mother, Elaine, creates authoritative identities at work and at home. To do this, she extends research suggesting that gendered identities are not fixed, but created in interaction (e.g., Tannen, 1994) and on positioning theory, which provides a discursive psychological understanding of how "selves" are produced (Davies & Harré, 1990). Analyzing multiple conversational extracts and integrating quantitative methods, Kendall finds that Elaine, in interactions with her 10-year-old daughter, constructs an explicitly authoritative maternal identity through how she formulates directives (e.g., "Go up and brush your teeth"). In contrast, at work when interacting with two female subordinates, Elaine downplays her authority, creating a manager identity that invokes benevolent authority (e.g., "You might want to mention that to them"). This research contributes to the academic dialogue on language and identity in highlighting the subtle linguistic means by which very specific kinds of gendered identities—like "authoritative mother"—are interactionally constructed.

Summary: Discourse Shapes Identity

In uncovering key linguistic features in identity construction, discourse analytic studies conceptualize identities as multifaceted. In Schifffrin's (1996, p. 199) words, "identity is neither categorical nor fixed: we may act more or less middle-class, more or less female, and so on, depending on what we are doing and with whom." Through its attention to the details of interaction, discourse analysis provides a powerful means of examining how identity construction occurs.

Conclusion

In conclusion, research in sociolinguistic variation and discourse analysis has considered identity as a relatively fixed "possession" (Tracy's cultural perspective) and as a fluid interactional creation (Tracy's rhetorical perspective). Thus scholars have uncovered both how social category membership and background experiences influence language use and how individuals linguistically portray shifting, multifaceted identities. While contemporary research tends to favor the rhetorical perspective, the two perspectives are not necessarily at odds. For example, Schilling-Estes (2004) demonstrates how incorporating social con-

structionist approaches into traditional sociolinguistic variation studies enriches findings and reveals both relatively fixed and fluid aspects of identity (see also Schiffrin, 1996).

In the spirit of interweaving disparate approaches and to achieve complex understandings of identity, Bucholtz and Hall (2005) outline a “sociocultural linguistic approach.” This approach emphasizes the multiple layers of any person’s identity, ranging from macrodemographic categories to momentary, fleeting positions taken up in conversation. It views identity as co-constructed and draws on the notion of indexing (Ochs, 1992), or the idea that identities are created through the dynamic construction of acts and stances in interaction. Bucholtz and Hall suggest that the “partial accounts” of identity created through studies taking singular approaches are useful. However, they also propose that integrating approaches—“including the microanalysis of conversation, the macroanalysis of ideological processes, the quantitative and qualitative analysis of linguistic structures, and the ethnographic focus on local cultural practices and social groupings” (Bucholtz & Hall, 2005, p. 607)—gives greater insights into the complex nature of identity and its construction. This general perspective is currently the dominant paradigm in the analysis of identity in interaction.

Analysis of Mediated Interaction

RODNEY H. JONES

Usually when we think of “mediated interaction” we think of interaction that is mediated through some rather conspicuous technology. And so, for example, we speak of “computer-mediated communication” or messages delivered via “mass media” like television, radio, or newspapers. In fact, however, *all* interaction is in some way *mediated*—at the very least through some kind of semiotic system like language.

The traditional definition of mediation is the passing of information through some kind of artifact that is inserted between two or more communicative partners. The problem with this definition is first that it equates interaction with the transfer of “information,” and second that it sees the message and the artifact through which it is transferred as two distinct entities, with the information seen as the important thing, and the media through which it passes seen as secondary and neutral, merely a kind of conduit through which messages pass.

The way applied linguists today think of mediation is rather different. Rather than neutral conduits for messages, media are seen as actively shaping our perception of phenomena, our relationships with those with whom we communicate, the meanings we can make and the actions we can take. The idea of what a medium is has also expanded beyond material apparatus like telephones and computers to include psychological, semiotic, and social entities like mental schemas and genres.

Innis (1951/1964) was one of the first scholars to argue that the media through which we communicate have a significant effect on what can be conveyed and how it is understood. All forms of communication, he said, involve a “bias” in terms of the way they handle space and time. McLuhan (1964/2001), building on Innis’s ideas, posited that media act as extensions of the human senses and that messages, what they mean and how they affect us, are inseparable from the media through which they are communicated.

Around the same time as McLuhan was revolutionizing the field of communication studies, sociologist Erving Goffman (1959) was pointing out that social interaction was not as simple and straightforward as people imagined. Comparing interaction to theater, he argued that, when we communicate with others, our meanings and identities are mediated through various kinds of “expressive equipment” (including physical props as well as personal attributes such as rank, clothing, sex, or age). Significantly for Goffman, the equipment through which we interact is designed not only to convey messages, but also to conceal information about ourselves or the situation that we do not wish other people to know.

The two most important figures in the sociocultural view of mediation which has most heavily influenced current work in applied linguistics are Mikhail Bakhtin and Lev Vygotsky. For Bakhtin (1981), all of our communication and interaction is mediated through the “voices” of other people. That is, in order to form utterances, we must borrow from previously formed utterances. For Vygotsky, all action in the world is indirect—mediated by various tools which have the effect of either *amplifying* or *constraining* certain social actions. The use of tools is, for Vygotsky, the hallmark of human consciousness and learning: the emergence of higher mental processes is grounded in the phenomenon of mediation. Therefore, tools and tool use provide a link between social and cultural processes and individual mental processes. Because mental functioning is carried out by mediational

2 ANALYSIS OF MEDIATED INTERACTION

means provided by the society, all thought is essentially social. At the same time, individuals appropriate and adapt mediational means for particular concrete purposes. Therefore, the relationship between individual consciousness and the mediational means provided by society is always dialectical, mediational means acting to both afford and limit actions, and individuals constantly adapting mediational means to fit the contingencies of particular circumstances and goals (Wertsch, 1994).

According to Vygotsky (1981, p. 137), mediational means are of essentially two types: "technical tools," consisting of material objects like a pole-vaulter's pole or a computer, and what he calls "psychological tools": "language; various systems for counting; mnemonic techniques; algebraic symbol systems; works of art; writing; schemes, diagrams, maps, and mechanical drawings; [and] all sorts of conventional signs." When actions are mediated through psychological tools, actors are less likely to be conscious of the fact of mediation (Wertsch, 2007, p. 184). This "transparency" of mediational means is particularly important when considering human interaction, in which often people connect meanings directly to the thoughts and intentions of their interlocutors, without being conscious of how the cultural tools through which meanings are mediated can limit or distort what is expressed or what is interpreted.

Applied linguists have been concerned with the way interaction is mediated through both kinds of tools: how technical tools, like telephones, computers, and the physical tools or "expressive equipment" of face-to-face interaction affect communication, as well as how semiotic systems and modes, rhetorical structures, registers and other ways of speaking and writing, and mental schemas mediate the ways we make and interpret meaning and negotiate our social relationships.

Work in applied linguistics on the effects of technical tools on the mediation of social interaction has become particularly popular with the advent of computers and the Internet (e.g., Herring, 2001). However, even some of the earliest work on the linguistic structure of social interaction focused on technologically mediated conversation. The initial insights of Sacks and his colleagues (Sacks, 1992, vol. I, 3) on the orderliness of conversation, for example, arose from the analysis of telephone calls.

Scholars concerned with technologically mediated interaction have generally focused on two primary media effects: first, the way technology affects spatial presence and visibility and the associated communicative cues, and second, the way it affects temporal and sequential aspects of communication.

Early work on text-based computer-mediated communication (CMC), for example, emphasized how the absence of the kinds of physical cues available in face-to-face interaction influences the ways messages can be delivered and understood. Initial predictions about this were based on a "deficit model" which assumed that fewer cues inevitably lead to less successful transmission of messages and less intimacy between interlocutors (e.g., Daft & Lengel, 1984). Later research, however, revealed the extent to which people are able to adapt to reduced cues and even how the constraints of technological media can actually result in feelings of increased intimacy between interactants (e.g., Walther & Burgoon, 1992).

Another concern of this early work was describing and analyzing the formal aspects of language used in CMC, particularly in relation to earlier work on the difference between spoken and written language. Characterizations of CMC as "interactive written discourse" (Ferrara, Brunner, Whittemore, 1991) that dominated early applied linguistics work on the subject have more recently given way to approaches which recognize the variety and context-specific nature of the genres and registers involved, and the complex, multimodal nature of those genres (especially in recent times) (e.g., Jones, 2005), as well as focusing more on discourse features of interaction along with the formal aspects of language use (e.g., Riva & Galimberti, 1998).

Work focusing on the effects of media on the temporal or sequential aspects of communication has, of course, focused on *asynchronous* interaction like e-mail and text messaging, but also on the more subtle effects of technological mediation on things like turn taking and conversational coherence in more synchronous forms of communication like voice-based telephony, chat, instant messaging, and video conferencing. One major issue has been the effects of temporality on message form, in particular how the pressures of synchronous mediated communication result in reductions in message complexity and the development of shorthand strategies. More relevant to the study of discourse and interaction has been work considering how technology affects the sequential organization of interaction: for example, the disruption of turn adjacency, unexpected overlaps or lengthy gaps between contributions, and the limitations on mutual monitoring of message production that make simultaneous feedback or interruption difficult or impossible (Cherny, 1999). The most important outcome of investigations of this kind has been the realization that, despite these limitations, technologically mediated communication is not interactionally incoherent, but rather participants develop a wide range of strategies to compensate for the apparent limitations and obstacles to interaction management imposed by technology (Cherny, 1999; Herring, 1999). Finally, researchers have explored the ways technologies can alter the participation structures of interactions (Marcoccia, 2004; Jones, 2009), not only allowing for various permutations of participation from one-to-one to many-to-many, but also facilitating multiple, simultaneous interactions, sometimes across multiple media.

Of particular interest for applied linguists has been work on the role of technologically mediated communication in language learning, with researchers examining the effects of mediation on such things as learner participation in interaction (Warschauer, 1996), affect and stress (Chun, 1994), and self-correction and the negotiation of meaning (Smith, 2003).

One problem with many approaches to technological mediation from a Vygotskian point of view is the tendency of studies to consider technologically mediated interaction as an imperfect replica of face-to-face interaction rather than as a form of interaction on its own terms and with its own goals, which might be quite different from those of real-time face-to-face talk. Such a perspective is particularly dangerous because it blinds researchers to the fact that face-to-face communication is also heavily mediated by all sorts of technologies that are so taken for granted that they have become invisible—technologies like dress, furniture, architectural layout, the human voice, and the various semiotic systems carried by these technologies.

The semiotic systems which mediate interaction are what Vygotsky had in mind when he spoke of “psychological tools.” Traditionally, the term *mode* has been used to refer to symbolic systems (writing, speaking, color, gesture) and *medium* for the physical substances through which these systems are transmitted (paper and ink, computer screens, telephones, the human body and vocal apparatus). *Modes* are also, however, themselves *mediational means* with certain built-in affordances for and constraints on the kind of meaning that can be made and the kind of actions that can be taken with them, and these affordances and constraints are often the result of the material dimension of modes.

This can perhaps be seen best in the difference between the spatial-temporal dimensions of language and images. While language is organized temporally, with meaning unfolding over time and the significance of elements (whether they be phonemes, words, clauses, or utterances) depending on the elements that came before and creating a context for those that will come later, visual images are organized spatially, with all of the information being presented simultaneously and their significance based on their placement in spatial relations with other elements (Kress & van Leeuwen, 2001). Another example of the difference between verbal and visual modes can be seen in Lemke’s (1999) distinction between *typological* meaning making and *topological* meaning making. Typological meaning is made

4 ANALYSIS OF MEDIATED INTERACTION

through assigning phenomena to culturally meaningful categories, whereas typological meaning is made by degree. Visual modes are more associated with topological meaning making.

The important thing about modes as mediational means is not so much their relationship to meaning as their relationship to action, how interactants use them as cultural tools, and mix them strategically with other cultural tools. In interaction, whether face to face or mediated through technologies like computers, people often shift modes (Jones, 2005) or modulate the degree of saliency of particular modes (Norris, 2004) in order to alter the terrain of affordances and constraints in a particular situation.

There has been increased interest in multimodality in the field of applied linguistics, especially as it relates to new literacies and to the analysis of conversation. Most of these approaches, however, see things like gesture, gaze, and image as supplementing or providing “context” for verbal messages. An approach which orients toward *mediation*, as does Norris’s (2004) multimodal interaction analysis, however, does not privilege language, but rather considers it one of many possible mediational means which people draw upon in interaction.

Along with modes and codes—the semiotic systems through which actions are mediated—psychological tools also include various conventional ways of using these systems. While the number of such “rhetorical” mediational means is potentially infinite, Bakhtin divided them into two main types: *speech genres* and *social languages*. Speech genres are the particular forms communication takes in various “typical” circumstances. They direct participants both into particular relationships with their interlocutors and into particular interpretations of what is said. Social languages are tools with which they construct identities. Bakhtin (1981, p. 262) defines them quite broadly as “social dialects, characteristic group behavior, professional jargons, generic languages, languages of generations and age groups, tendentious languages, languages of the authorities of various circles and of passing fashions, languages that serve the specific sociopolitical voices of the day.”

The difference between the way an approach focusing on mediation deals with such forms and the way they have traditionally been dealt with in applied linguistics, literary studies, rhetoric, and other language-based approaches is that they are not seen so much in terms of linguistic behavior characteristic of particular groups, or in terms of structures and variation, but rather as tools that people appropriate strategically to perform social actions, negotiate interactions, and enact social identities.

Understanding mediated interaction cannot rely on an approach which focuses solely on the mediational means, whether technological or semiotic, with which people conduct interactions. Such an approach would risk falling into technological determinism or linguistic formalism. Similarly, mediation cannot be understood by focusing solely on the individuals who take actions or on the societies or cultures which supply them with the mediational means with which to do so. This would risk essentialism, psychological conjecture, and stereotyping. The only viable unit of analysis for understanding mediated interaction, or, more properly stated, to understand the mediated nature of all interaction, is the visible, real-time, concrete *mediated action*. A focus on how interactions are made up of mediated actions through which interactants claim and impute identities, and position themselves in relation to their interlocutors and larger social groups, helps to link issues of semiotic form and technological affordance with broader issues of culture and ideology. The concept of mediation also serves to link interaction on the inter-mental plane with that on the intra-mental plane, what Vygotsky (1981) referred to as “inner speech.”

In psychology such a perspective has come to be known as the sociocultural approach to mind (Wertsch, 1994; Cole, 1996). In applied linguistics it is best represented by the work of Ron and Suzanne Scollon (Scollon, 2001; Scollon & Scollon, 2004) in their formulation of *mediated discourse analysis*, a framework which has informed the study of interactions in a wide variety of contexts including coffee shops, classrooms, courtrooms,

clinics, and computer terminals. The Vygotskyian notion of mediation has also had a significant influence on research in other domains of applied linguistics, especially language education (Lantolf, 2000).

Analysis of Narrative in Interaction

CYNTHIA GORDON

Introduction

Narrative has been widely studied across the social sciences and humanities. This is due to its ubiquity: All human groups have narratives (Barthes, 1977, p. 79). Narrative has also earned scholarly attention due to its fundamental role in sense making: As Georgakopoulou (2007, p. 32) explains, narrating “is invariably thought of as involving meaning making” and the “ordering and structuring” of experience. Due to the multidisciplinary, multifaceted nature of narrative scholarship, the term “narrative” has many meanings, referring to everything from works of art that convey a story to abstract cognitive schemata that help humans interpret experiences. Within linguistics, narrative is typically (but not exclusively) understood as a verbal means of “recapitulating past experience” that invokes the sequentiality of events and makes a particular point (Labov, 1972, pp. 359–60; see also Labov & Waletzky, 1967).

Analysis of narrative in interaction contributes to understanding the complex interplay of story content (what is said), structure (how it is said), and function (what the narrative accomplishes). It is not only the study of particular narrative tellings, however, because narrative plays a key role in understanding how “personal lives and social institutions intersect” (Riessman, 2008, p. 3) and how culture-wide ideologies shape individual conceptualizations and discursive representations of experiences and relationships (Tannen, 2008). Thus the analysis of narrative lends insight into storytelling as a linguistic phenomenon, while also addressing how human beings achieve coherence, meaning, and identity within sociocultural contexts.

This entry first gives a brief overview of two primary meanings of narrative: a concrete telling and an abstract (cognitive) structure. Second, it describes how narratives are collected for analysis and transcribed. Third, it gives an overview of three key narrative elements that have been investigated: narrative structure, linguistic features and narrative functions, and cultural aspects of narrative. The conclusion highlights why the study of narrative is important for applied linguistics.

Basic Definition of Narrative

Based on seminal work in sociolinguistics by Labov (1972; Labov & Waletzky, 1967), narratives—and especially narratives of personal experience—are broadly understood as stretches of talk produced through linking events into a temporal structure that not only conveys what happened, but also the speaker’s perspective on the reported sequence of events. These narratives are past-oriented; generally about a specific, actual experience; internally structured; and considered to be the products of individual speakers.

While the Labovian definition of narrative, which emerged out of the analysis of narratives elicited in interviews, is the touchstone for most contemporary narrative research in linguistics, it is not the only one available. A broader definition is needed to encompass narratives that arise organically in everyday talk (e.g., Georgakopoulou, 2007) and across

cultural groups (e.g., Scollon, 2010). A paradigm known as “small stories” (see e.g., Bamberg, 2004; Georgakopoulou, 2007) investigates nonprototypical stories—those that are minimal, jointly told, hypothetical, untrue, habitual, incomplete, or even only alluded to—arguing that these are important in human meaning making and identity construction. Contemporary understandings of narrative thus tend to move beyond (but not exclude) Labov’s seminal definition.

In addition to referring to stretches of talk, the term “narrative” also has abstract meanings. For instance, an individual story might index a larger “cultural narrative,” meaning a shared understanding, expectation, or ideology. This meaning is captured in Tannen’s (2008) differentiation between three types or levels of narrative, based on Gee’s (1999) concepts of big-D and small-d discourse (culture-wide ideology versus specific words spoken, respectively). Tannen (2008) suggests that narrative scholarship can usefully differentiate between small-n narrative (a telling of a particular story), big-N Narrative (an abstract theme realized across small-n narratives), and Master Narrative (a cultural ideology that shapes big-N Narratives and how small-n narratives are told). This terminological distinction captures contemporary uses of “narrative” in the field; for instance, Linde (2009) investigates an insurance company’s “stable narrative of identity” (an abstract theme or understanding) via analysis of individual stories told about the workplace and its employees. While the analysis of narrative tends to refer to the detailed examination of what Tannen (2008) calls small-n narratives, “a good narrative analysis” also makes “a move toward a broader commentary” (Riessman, 2008, p. 13), and thus may incorporate more abstract understandings of narrative.

Collecting Narratives for Analysis

Verbal narratives must be collected through audio-recording (and sometimes video-recording) interaction. Some scholars conduct interviews using questions specifically designed to elicit narratives, such as “Were you ever in a situation where you thought you were in serious danger of getting killed?” (Labov & Waletzky, 1967). Others examine narrative segments that emerge in semi-structured sociolinguistic interviews (e.g., Schiffrin, 1996) or in “focused conversations” about a given topic (Tannen, 2008). Narratives that emerge organically in naturally occurring conversations such as family dinners (e.g., Blum-Kulka, 1997) or conversations among friends (e.g., Georgakopoulou, 2007) are increasingly of interest. Another method is comparative: of spoken and written narratives (e.g., Tannen, 1986), of narratives told in different languages (e.g., Tannen, 1986), or of narratives of different cultural groups (e.g., Blum-Kulka, 1997).

Verbal narratives, once collected, must be transcribed, to facilitate systematic, close interpretation (quantitative methods may also be employed, but qualitative methods predominate). Transcription goals and conventions differ across studies. Sometimes a narrative is transcribed as a text produced solely by an individual in response to a researcher’s question, especially in early studies (e.g., Labov, 1972); such narratives are occasionally edited or “cleaned up” to highlight story structure (e.g., Gee, 1986). The content of talk is the focus of some transcriptions, producing a paragraph-like representation of narrative (e.g., Linde, 2009), while others aim to capture the rhythm of talk, which results in a poetic representation (e.g., Gee, 1986; Tannen, 2008). In many contemporary studies, especially of conversational narratives, all co-interlocutors’ contributions are transcribed in detail (e.g., Blum-Kulka, 1997; Georgakopoulou, 2007) to facilitate examination of narrative co-construction. Such different transcription styles—choices about whether to include copresent interlocutors’ talk, how to “chunk” narrative parts, and so on—point to scholars’ different perspectives and interests. There is no one “correct” way to transcribe narrative;

however, all transcripts must be accurate and internally consistent.

Analyzing Narratives in Interaction

The analysis of narrative is accomplished through a “family of methods” rather than a single approach (Riessman, 2008, p. 11). This is due to the multidisciplinary nature of narrative inquiry and the variety of interconnected concepts available to linguists who study narrative, including those from literary theory, psychology, sociology, and anthropology. Linguistic analyses of narrative have drawn on these fields in different ways, and to different degrees, over time. Early sociolinguistic research focused on outlining narrative structure. Subsequent research, especially in discourse analysis, moved toward a greater understanding of narrative as embedded in interactional context and of characteristic linguistic devices of narrative. Such studies have also examined narrative functions, and especially how narratives work to construct relationships and identities. Investigations of cultural differences in narrative norms and practices add richness to the field and tend to be informed by anthropological perspectives.

Narrative Structure

The structural approach to narrative in linguistics can be traced to the work of Labov (1972; Labov & Waletzky, 1967). Labov offers what he calls a “formal” approach to narratives of personal experience, exemplars of which he elicited while investigating everyday or “vernacular” language, in particular what was then called Black English vernacular. By eliciting emotionally charged stories, Labov (1972, p. 345) was able to encourage speakers to become “deeply involved” in the telling; he was thus able to collect the relatively unmonitored, casual speech he wanted to study. While Labov did not initially plan to study narratives per se, he found them to be rich evidence for a point he was arguing—that the language of urban Black children and adolescents was not linguistically deficient—and he set out to understand the structural components of narrative more generally.

The clause is identified as the basic structural unit of narrative by Labov and Waletzky (1967); Labov (1972) presents a modified, less formal, and more accessible version of this framework (“The transformation of experience in narrative syntax”). The temporal dimension achieved across clauses is vital: Labov (1972, p. 360, original emphasis) defines a minimal narrative as “a sequence of two clauses which are *temporally ordered*” (and therefore fixed vis-à-vis one another); this means that “a change in their order will result in a change in the temporal sequence of the original semantic interpretation.”

Narrative clauses in a “fully developed” narrative are organized into a larger structure, of which each element has its own function (Labov, 1972). The structure provides a vocabulary of narrative parts that has proven useful in subsequent research, even if only as a point of departure. These elements include an *abstract* that summarizes the story’s point, an *orientation* which sets the scene, the *complicating action* which consists of the pivotal event around which the narrative is organized, the *result* or *resolution* that tells what finally happened, and the *coda* which signals the narrative’s end. *Evaluation*, “perhaps the most important element” along with the temporally ordered clauses (Labov, 1972, p. 366), occurs throughout; it is essential because it works to reveal the point of the story. Evaluation can be embedded within the narrative (*internal evaluation*) or stated by the narrator by stepping outside the telling (*external evaluation*).

The elements outlined by Labov collectively create a coherent narrative and provide researchers with a means of breaking up narratives into analyzable parts. And, while Labov’s work has been profoundly influential (see e.g., Bamberg, 1997a), his is not the

only important structural approach. Gee (1986), for example, explores the textual boundaries within narrative discourse by considering pausing and other prosodic phenomena tellers use, rather than the functions of narrative parts. In this way, he views narratives as having somewhat of a poetic structure, being composed of *parts*, *strophes*, *stanzas*, and *lines*. Through this organization, narrative themes become apparent and the units of narrative production can be delineated.

Linguistic Features and Narrative Functions

Linguists have given attention not only to narrative structure or form, but also the linguistic strategies that characterize narrative as a genre and simultaneously accomplish myriad functions. It is widely recognized that narratives are told to remember, to argue, to persuade, to entertain, and to provide accounts, among other things (see e.g., Riessman, 2008). These functions are achieved through a range of linguistic features, including repetition, word choice, and uses of intonation. Creating identities and relationships is the most prominent, and widely studied, function of narrative discourse, and this function is arguably universal.

Narrators tell stories in ways that display themselves as being certain kinds of people, and as having certain relationships with others. Bamberg (1997b) argues that narrators linguistically create identities via accomplishing positioning (Davies & Harré, 1990) between the narrator and the copresent audience, between the narrator as a story character and other characters, and between the narrator as teller and as a character in the story. Also drawing on positioning, Wortham and Gadsden (2006) emphasize how identities are created as speakers position story characters as recognizable types. Thus they demonstrate how one narrator, an urban African-American man who became a father as a teenager, uses linguistic devices like quoted speech and other forms of evaluation to portray his identity change from a kid oriented toward the street to a responsible father oriented toward home. Taking a related approach, Schifffrin (1996) focuses on a broader set of linguistic features used by narrators to metaphorically paint “self-portraits” of themselves in sociolinguistic interview discourse. Thus two women portray their family identities and the complex relationships they have with younger women in their families through metaphor, reported-speech, intonation, terms of personal address, and speech acts.

Relationships are not only constructed between the characters in the told events; they are also created in the interaction between the narrator and copresent interlocutors. Analyzing spoken and written narratives in English and Greek, Tannen (1986), for example, investigates a feature common in many narratives—what she calls “constructed dialogue”—which refers to the creation and animation of character dialogue (sometimes called reported speech). This strategy, often accomplished using paralinguistic features like pitch and volume, contributes to the production of a vivid story and ultimately creates involvement between speakers and their audiences.

Narratives do identity-work and relationship-work for individuals but also for groups. Langellier and Peterson (1993, p. 50), for example, suggest that a family is “one type of small-group culture strategically produced in discourse such as family stories.” Ochs and Taylor (1995) too identify narratives as constitutive of families; they suggest that mealtime narratives in American families create shared family beliefs while simultaneously differentiating role identities for family members. Ochs and Taylor’s examination of how narratives are introduced, (co)narrated, and evaluated leads them to identify a gendered pattern wherein mothers encourage children to tell stories to fathers, who subsequently judge children’s stories (they call this the “Father knows best” phenomenon). Ochs and Taylor underscore how narratives create hierarchical family relationships; however, such family patterns of telling also are oriented toward family solidarity (see Tannen, 2001). In

similar ways, narratives create coherent identities for institutions, both shared values and hierarchical relations among institutional roles (Linde, 2009).

Identity-work is a primary function of narrative, but it is not the only one. Telling narratives can also be therapeutic and can help people manage disruptive life events like infertility and divorce (Riessman, 2008). Narratives too can be used to describe breaking news or to project into imaginary situations that could occur in the future (Georgakopoulou, 2007). Because narratives can be embedded in virtually any type of interaction, can be told using a range of structural forms and linguistic elements, and are co-constructed in interaction, the possibilities for narrative are almost limitless.

Cultural Aspects of Narrative

In addition to highlighting individual differences in narrating (e.g., uses of particular linguistic strategies to portray a specific identity in interaction), linguists have also explored cultural variation. Cross-cultural research has shown how what a story can be about, how it is structured, and so on, can differ. For instance, Scollon (2010) finds that Athabaskan, Chinese, Javanese, and Arabic narratives diverge in consequential ways from Labovian narratives, including the required temporal element. He suggests that diverse uses of rhythm, theme, and so on, provide culturally appropriate (but perhaps not universally recognized) coherence.

Blum-Kulka's (1997) study of family narratives also demonstrates the cultural-embeddedness of narratives. Blum-Kulka examines dinnertime conversations of Jewish American, American Israeli, and Israeli families. While she uncovers similarities—storytelling occurred in all families, and dinner conversation was an important context for children's socialization into narrative and other discourse practices—she also uncovers differences. For example, in American families, children were the primary narrators; in Israeli families, adults were. This fits in with a broader cultural pattern of American families' focusing on children. Another example is Tannen's (1986) comparison of Greek and American English narratives told by women about a time they were molested; Tannen found that the Greek women used much more constructed dialogue than the Americans did. She suggests that this is characteristic of Greek storytelling conventions.

There are also subcultural narrative differences. For instance, Labov (1972) suggests that middle-class speakers are more likely to use external evaluation (state the story's point outright), whereas lower-working-class speakers tend to use internal evaluation (indicate the point in indirect ways). Like Scollon (2010), Gee (1986) suggests that not all cultural groups emphasize narrative temporality. Gee analyzes a young African American girl's classroom "show-and-tell" story in demonstrating how while thematic (rather than temporal) coherence can structure a story, this coherence is not necessarily recognized by members of other groups in the USA (like the girls' White teacher).

These studies suggest that while identifying structural and/or functional commonalities is important in understanding the universal "narrative impulse" (Riessman, 2008, p. 21), studying differences increases understanding of the diversity of narrative forms available, as well as their functions.

Conclusions

Narrative is widely recognized as playing a vital role in human sense-making, as well as the interactional construction of relationships and individual and group identities. It is increasingly suggested that narratives need to be considered as embedded in unfolding interaction, and as diverse: Patterns of telling, linguistic features used to make a narrative point, and how narratives are used in interaction may differ across cultures, small groups

like families and institutions, and individuals. The study of narrative in interaction is thus not only the study of a particular kind of discourse, but a study of how self, meaning, society, and culture intersect in various ways through language.

The analysis of narrative is especially important in the context of applied linguistics, not only for academic, but also for practical and social justice reasons. For example, Gee's (1986) study reveals that the narrative of a child from a racial minority group is not accepted as the "right" way to tell a narrative at school; this can contribute to achievement gaps across groups. More broadly, Scollon (2010) points out that temporal narrative structure is not universal (although it often is treated as such). He suggests that while this has profound implications for how academics understand and study narrative, it also has implications for how narratives—and their tellers—are evaluated in real-world contexts. Thus the study of narrative in interaction has implications not only for our conceptualization of the role of language in meaning making, but also for our understanding of human experience.

Analysis of Silence in Interaction

DENNIS KURZON

Introduction

Silence has long been regarded as meaningful in interaction. Since the 1970s, there have appeared studies of silence, which analyze the functions of silence in interaction. At first, there were sporadic publications such as Bruneau (1973), Jensen (1973), and Johannesen (1974), but in the middle of the 1980s the first collection of papers on silence was published (Tannen & Saville-Troike, 1985), which included a broad range of papers on silence not only in, for example, conversation, worship, witness questioning in court, and the classroom, but also from a cross-cultural perspective. This was followed, over a decade later, by a second collection (Jaworski, 1997), which included studies of silence and politeness, markedness theory, and silence in medical interviews as well as silence “beyond language,” such as in painting and in music. Furthermore, two monographs (Jaworski, 1993; Kurzon, 1997) were published in the 1990s as well as several other articles. Linguistic research into silence has since expanded with, for example, Cortini (2001), and a further collection edited by Jaworski (2005), which includes papers on silence in institutional settings such as the classroom, television reporting, and antenatal clinics.

One may also speak of silence in computer-mediated communication (CMC). Not only is it often carried out in silence—“silent interactivity” (Rennecker & Godwin, 2003)—but the time it takes for an addressee to respond to a message may allow the addresser to distinguish between a show of interest (a short silence), on the one hand, and a potential end to the interaction (a far longer silence), on the other (Kalman, 2008; Jones, in press).

Silence has also been central to gender studies and critical discourse analysis, especially regarding the silencing of women (from the seminal work of Lakoff, 1975, to Langton, 1997, and Sbisà, 2009).

In order to interpret silence, we always need a context, in which are involved two or more people who interact with each other in one way or another. The prototypical situation is a face-to-face conversation between two people (called dyadic interaction), but conversations do take place where there are more than two people involved (multiparty interaction). Conversations include not only informal encounters but also television interviews, job interviews, or even police interrogations. Not all conversations, however, need be face-to-face; they may also include telephone conversations and radio phone-in shows.

Moreover, interaction among people may also take place in writing where the two or more people involved are not facing each other, but may be far away, and at a considerable time interval from each other. The people involved in this type of interaction are writers and readers, not only those of literary works (where the writer may no longer be alive), but also writers of op-ed articles or editorials in the newspaper and readers who respond by sending letters to the editor, scholars responding to an article in an academic journal, people who communicate by e-mail, and of course by other electronic means of communication which rely on the written language, such as blogs, or tweets on a Twitter network. While participants in a face-to-face conversation may react immediately to what is being said by another participant, and react, too, to facial expressions and gestures of other participants, in written texts the dynamics between writer and reader can vary

2 ANALYSIS OF SILENCE IN INTERACTION

enormously, especially from the perspective of formality. For example, in letters to the editor and in academic articles, the language tends to be standard, while in much electronic communication, conversational style is preferred.

Both in conversation and in written texts, however, language is at the core of the interaction. The dynamics of verbal interaction allow participants to interpret and reinterpret what is being said according to the context. Meaning is created not only by the person who is speaking or writing, but also by those who interact with him or her. If no language is being used, however, what is there to interpret, and furthermore, how is meaning generated? It is therefore paradoxical to regard as interaction a situation in which no words are exchanged—silence.

It should be pointed out that since the focus is on silence in interaction, cases in which a person is on his or her own should not be included. People are not expected to speak to themselves (although this may at times occur with everyone and not only in pathological cases). Therefore, the silence of someone on his or her own may be considered the unmarked case in the sense that speaking to oneself is marked. On the other hand, silence in dyadic or multiparty interaction may be considered marked in that speech is the normal activity in such situations.

Three Types of Silence

There are basically three types of silence (following Kurzon, 2007; 2009), all of which may be timed: conversational, textual, and situational. Silence as in the phrase “she was silent about something” is not considered here a type of silence (see below).

Conversational Silence

Conversational silence is the silence that occurs in cases, as mentioned above, where two or more people are having a conversation. Before looking at specific examples, we have to relate again to formality. That is to say, speech (including writing) may be highly formal, or highly informal, with a large area in which we gradually move from formality to informality. We may illustrate conversational silence by looking at a number of different cases in which informal and more formal conversation takes place. The first subtype of conversational silence, often referred to as a pause, is a very short silence, in which a participant does not respond immediately to what is said, but pauses, for example, to collect his or her thoughts. Here follows an example of this subtype (from Sacks, Schegloff, & Jefferson, 1974, p. 702):

Jeanette: Oh you know, Mittie- Gordon, eh- Gordon, Mittie's husband died.
(0.3)
Estelle: Oh whe::n.
Jeanette: Well it was in the paper this morning.
Estelle: It wa::s,
Jeanette: Yeah.

There is almost a third of a second silence (or pause) before Estelle reacts to the news that Mittie's husband has died. We could interpret this silence as the need for Estelle to digest the news, which seems to be a surprise, before she reacts.

Second, we may have a situation in which at least two persons are having an informal conversation, and one of the participants is asked a question, or a comment is made directly to him or her, and she or he does not answer—is silent. For example:

John: Hi, Pete, who was that woman I saw you with last night?
(4.0)

Pete does not respond to John's question (the four-second silence is an arbitrary length of silence to distinguish it from a pause), since he probably does not want to divulge any information concerning the identity of his female companion.

The third case of conversational silence is where a participant in a multiparty conversation is physically present, but does not say a word—she or he is silent. Such cases require at least three participants, since a conversation is taking place between the two (or more) people who are talking, while the third person is silent.

So far, we have described cases of conversational silence in which the situation is informal; these examples of conversation might take place among family members, friends, or acquaintances. There are occasions when conversations—either dyadic or multiparty—may take place in more formal settings such as police interrogation rooms or job-interview situations. The first situation may be illustrated by the right of silence, known in the USA as Miranda, part of which reads:

You have the right to remain silent. Anything you say can and will be used against you in a court of law.

A suspect in police interrogation, or even someone who is being arrested, has to be told that she or he may remain silent. So the suspect may refuse to answer any or all of the questions in order not to incriminate himself or herself (e.g., Kurzon, 1995). In the second situation—that of a job interview—a candidate may not answer a question put to him or her by the interviewer or the interview panel for various reasons, but since it is the candidate who has to impress the interviewer(s), it is not to his or her advantage to remain silent.

Much of the research on silence deals with conversational silence. Even early studies of silence in diverse societies tend to relate to this type of silence. Basso (1970), for example, examines cases of silence among Western Apache Indians in the USA, identifying six situations in which silence is preferable to speech. Likewise, Nwoye (1985) looks at the function of silence in conversation among the Igbo of Nigeria. Lehtonen and Sajavaara (1985; revisited in Sajavaara & Lehtonen, 1997) discuss the well-known phenomenon of silence among Finns, in which long periods of silence can occur where in many other cultures silence would not be tolerated.

Textual Silence

The other two types of silence in the typology introduced above relate to situations in which a group of people are silent. We necessarily have to relate to a *group* of people, since we are looking at silence as a type of interaction, in which at least two people have to be present or be interacting in one way or another, though both are silent. In conversational silence, on the other hand, one of the participants may be silent while the other participant or participants are talking. In the first of these two types of silence, the silence is caused by the participants reading a text or reciting a text to themselves; hence the term “textual silence.” This silence may be informal when it occurs in a person's living room where two or more members of the family, or friends, are sitting down reading the newspaper, a magazine, or a book. More formal contexts, which also seem to be more prototypical, would be the silence in the library or the silence in a place of worship. The silence of the library derives in part from the wish of each of the library users to concentrate on what he or she

4 ANALYSIS OF SILENCE IN INTERACTION

is reading, whether it is a book, an article in a journal, or information on a computer screen. This silence is reinforced by notices put up asking for patrons to be silent.

Silence in a place of worship as textual silence does not refer to the silence that is maintained in a church, for example during a tourist visit, similar to the silence in museums, but to the occasions during a service when silent prayer is called for. That is to say, the silence derives from the fact that worshipers have reached a place in the service in which a silent prayer is recited. This may occur, for example, in a Catholic church in the period of silent reflection before the opening of the mass, or in a synagogue where in each of the three daily services the worshipers have reached the Eighteen Benedictions, which are said in silence. Like conversational silence, textual silence can be timed. The silence may be maintained as long as it takes the reader to read or recite the text, or as long as a person is present in the library.

Situational Silence

The third type of silence relates to a group of people who are not ostensibly reading or reciting a text. It usually occurs in specific formal situations such as war remembrance ceremonies when a minute or two minutes of silence is observed. What happens in participants' minds is not set down. Proposals as to what people should think about have been made, for example when a one-minute silence was established on Armistice Day in Britain in 1919, a year after the end of World War I. Gregory (1994, p. 12) relates to what should go on in people's mind—what they should be thinking of during the silence:

people were not expected to be empty of all thought and emotion. It was expected that the time would be filled with private contemplation of the meaning of the war, with prayer, with a renewed commitment to certain goals.

This reflects what was written in the newspapers at the time. The *Daily Herald* laid down:

You will remember, mothers, the gay sons you have lost; wives, you will *think* of the husbands who went out in the midst of the winter morning—the mist that sent cold chills round the heart—never to come back. And brothers will *think* of brothers and friends of friends, all lying dead today under an alien soil. (Gregory, 1994, p. 12; my emphasis)

A one-minute silence is also observed at the beginning of each school day in public schools in over 20 US states. In a number of states, this has been a subject of controversy, reaching the Federal Supreme Court. In those instances in which the law establishing the minute of silence in public schools is considered constitutional (that is to say, as not infringing the establishment of religion clause of the First Amendment), no text is laid down in the statute for the children to think about. As the judge in one of the leading cases on this issue, *Brown v. Gilmore* (in 2001), wrote in his judgment:

The minute of silence established . . . for each public school classroom is designed to provide each student at the beginning of each day an opportunity to think, to meditate, to quiet emotions, to clear the mind, to focus on the day, to relax, to doze, or to pray—in short, to provide the student with a minute of silence to do with what the student chooses. (258 F.3d 265 (4th Cir. 2001))

This type of silence is also that found, as mentioned above, in museums, art galleries, and places of worship (but not during a service), where people walk around looking at the exhibits or at the architecture in a hush so as not to disturb anyone else. Of course, in

all these instances, people may be found talking, but very often in a whisper, since the convention does lay down silence.

A notorious example of situational silence is that of 4' 33", a work of John Cage, the American avant-garde composer, in which the performer or even the entire orchestra sits still for four minutes and thirty-three seconds, and does not play a note. The only action of the performer is to turn the page after a certain time. The audience is silent, expecting a piece of music as is usual in a concert hall.

"To Be Silent About"

While the typology presented above relates to timed silence—a person does not say anything or does not react—one may also say of a person who is speaking but who omits a topic that is expected that she or he is silent. Politicians in their speeches, for example, may leave out a topic that may be embarrassing. However, "to be silent about" may be argued to be Anglo-centric, since it occurs in some languages such as English, while a different verb or phrase with the meaning "not talk about" has to be used in other languages such as French.

Let us then compare several languages to illustrate the distinction between *to be silent*, meaning 'not to talk', and *to be silent about*, meaning 'not to talk about'. First, languages which use the same basic morpheme (usually an adjective or a verb) will be presented, followed by languages in which different morphemes are used. English uses the same adjective, as mentioned above. In these examples, the verb or adjective meaning 'silent' is underlined:

- (1) She is silent.
- (2) She is silent about that matter.

Likewise, German:

- (3) Sie hat geschwiegen.
'She was silent.'
- (4) Er hat diese Sache verschwiegen.
'He was silent on this matter.'

and Japanese:

- (5) kanojo wa damatteiru.
she TOP silent (verb).
'She is silent.'
- (6) sono koto nitsuite, kare wa damatteiru.
that matter about, he TOP silent
'He is silent about the matter.'

(where TOP refers to the topic of the sentence).

In Russian, however, we have different morphemes:

- (7) Ona molchit.
'She is silent.'

- (8) Ob etom v dolade ničego bylo skazano.
 About this in the report nothing was said
 'The report was silent on that point.'

and in Chinese (Mandarin):

- (9) Tā baochi chenmo
 'She is silent.'
- (10) tā meiyou tan zhejian shi
 she NEG talk ART.QUANT matter
 'She is silent about the matter.'

(where NEG means "Negation" and QUANT means "Quantifier").

Conclusion

Silence as a technical term in applied linguistics and in allied fields is defined here as a situation in which a person or a group of persons who are interacting with others, or, in the case of a group, interacting among themselves, does not say anything. Moreover, the silence in all these cases may be timed—from a pause of a fifth of a second when a person collects his or her thoughts to the duration of a silent prayer or to the conventional one or two minutes of situational silence. On the other hand, since a person who is silent about an issue (as one can say in English) while talking is not silent, such a silence is metaphorical, though it is part of an interaction.

Analyzing Spoken Corpora

MICHAEL MCCARTHY AND ANNE O'KEEFFE

Spoken corpora are collections of spoken texts, either in the form of transcripts alone or accompanied by audio or audiovisual recordings, stored in a computer and made available for analysis using customized software programs. Spoken corpora have grown in importance in recent years and a number of major corpora now exist for English and other widely used world languages. Spoken corpora are typically compiled using data from a range of sources, sometimes by very general demographic sampling, or sometimes in more specialized contexts. Transcription of the data may be broad or narrow, but usually includes some kind of nonverbal or nonlinguistic data. The tools of corpus linguistics can be applied to spoken data in a variety of ways, enabling researchers to learn about relative frequencies of words and patterns in different types of spoken data or in contrast with written data.

Introduction

Spoken corpora are collections of transcripts of real speech, typically consisting of speech events recorded on analog or digital recording equipment and then transcribed and stored in a computer as text files. *Spoken corpora* are often distinguished from *speech corpora*: speech corpora are usually collections of speech (which could be anything from transcripts of spontaneous speech to recordings of people reading out loud prepared lists of single words) that are compiled for purposes such as creating automatic voice-to-text applications, telephone technology, or the analysis of the phonetic substance of speech (Harrington, 2010). Researchers who create speech corpora are not necessarily concerned with what is said; they are more concerned with how it is said, that is, the speech signal itself. Researchers who work with spoken corpora are typically interested in what people say, why they say it, and how they use spoken language to communicate their messages and to interact with one another. Spoken corpora are, by definition, a recent development; before tape recorders became common, the only way to record people's natural spoken interactions was by observation (or eavesdropping) and attempting to write down what was said (e.g., Timmis, 2010). Relative to written corpora, spoken corpora are few. However, one of the first computational studies of collocation (Sinclair, Jones, & Daley, 1970/2004) was based entirely on a spoken corpus.

Characteristics of Spoken Corpora

Spoken corpora may be of different kinds and may include anything from formal, monologue events such as lectures and speeches to informal conversations between two or more parties. The settings where recordings are made may vary from people's homes and workplaces to stores, restaurants, broadcasting studios, and classrooms. Another dimension along which spoken corpora may vary is the purpose of the interactions they contain: the conversations might be debates, transactions of information, goods and services, narratives, media interviews, therapeutic sessions, and so forth (see McCarthy, 1998, for a description of the various contextual settings that went into the construction of one spoken corpus). Finally, the participants who agree to be recorded for the corpus may be a cross section

DOI: 10.1002/9781405198431.wbeal0028

of the general population (see, for example, information on the demographic sampling that underpinned the spoken segment of the British National Corpus at www.natcorp.ox.ac.uk/corpus/creating.xml), a particular social group, for example, teenagers (as exemplified in the COLT corpus of London teenage speech; see Stenström, Andersen, & Hasund, 2002), or a specialized professional group, for example, business people (Handford, 2010). A spoken corpus will usually have speaker information data linked to each recording which allows for sociodemographic research about language use across age, gender, geographical origin of the speaker, and so on (see Crowdy, 1993). These data provide “metadata” or more information about the speakers stored outside of the corpus.

Understanding the Spoken Transcript

Before a corpus is analyzed, the compilers make decisions about how to transcribe it. Consider this extract from the Limerick Corpus of Irish English (see Farr, Murphy, & O’Keeffe, 2004, for details of the corpus).

<\$2> I came up with all kinds of things+
 <\$1> Umhum.
 <\$2> +I found that even though I wasn’t able to look at my tape I realized that I hadn’t
 eh my instructions were not clear at the+
 <\$1> Umhum.
 <\$2> +because they weren’t sure exactly what I wanted I didn’t check and see to
 ch= see if they really understood the probability factor and <\$2> <\$G?> <\\$02>+
 <\$1> <\$02> Yes <\\$02>.
 <\$2> + <\$G?> and I just kind of went bluh here it is.
 <\$1> Umhum.
 <\$2> So it’s like I just threw it at <\$X> ’em | them <\\$X> and I feel badly about that
 em I let the students distract me with their comments and their ideas.

Everything marked with unfamiliar symbols (such as the diamond brackets < >, the dollar signs, the backslashes, etc.) is there to assist the analyst in some way. The tags <\$1> and <\$2> mark the individual speakers, numbered in the order in which they first speak. Somewhere in an accompanying database, we can find out their sex, age, social background, where and when the conversation occurred, and so on, and, if necessary, we will find a file number that can take us back to the audio recording. With the latest digital technology, we may also be able to play the audio recording while we read the transcript. The plus signs (+) indicate that someone has not finished what they were saying and that someone else has said something in the middle of the utterance (e.g., *umhum*), which then continues. Symbols such as <\$G?> indicate that the transcriber could not make out what the speaker was saying. The backslash \ indicates the end of a numbered overlap, where two speakers speak simultaneously. The vertical line | separates a nonstandard form (in this case *’em* from the standard form *them*). All of these conventions are invaluable to the analyst, for reasons we shall see below. In addition, transcribers have to decide how to transcribe vocalizations that are not usually recognized in the dictionary as “words” (e.g., *umhum*, *bluh*, *eh*), or half-uttered words such as *ch=*. Other decisions may include whether to transcribe the corpus showing intonation and stress patterns (Cheng & Warren, 2000; Warren, 2004; Cheng, Greaves, & Warren, 2005).

The presence or absence of extra levels of detail in a transcript is usually dictated by available time and resources: transcription is time-consuming and expensive, and researchers often have to economize and omit features in the transcript which might have been invaluable.

able to the analyst. Whatever the resource limitations, transcribing always involves choices, and no one can transcribe absolutely every relevant feature of a spoken interaction (Cook, 1990). What matters to the analyst is to have important features transcribed so that they are automatically searchable wherever possible. Increasingly, spoken corpora are supplemented by linked video images, which offer further analytical support to the written transcript and audio material (Adolphs & Knight, 2010; Thompson, 2010). Adolphs and Knight (2010) advise that there is a need to follow certain guidelines when transcribing if you want to make your corpus reusable to the wider research community. There are a number of different types of transcription guidelines available, such as those adopted by the Network of European Reference Corpora (NERC). Another set of guidelines is provided by the Text Encoding Initiative (TEI) and has been applied, for example, to the British National Corpus (BNC—see Sperberg-McQueen & Burnard, 1994). As Adolphs and Knight (2010) explain, these guidelines include the representation of structural, contextual, prosodic, temporal, and kinesic elements of spoken interactions and provide a useful resource for the transcription of different levels of detail required to meet particular research goals.

Analytical Tools

Different analytical techniques will provide a range of results which reveal distinct aspects of the spoken material. With free or proprietary software suites, it is usually possible to generate frequency lists which arrange all the words in the corpus in order of frequency, from the most common to the rarest (see Scott, 2010; Evison, 2010). With such lists, we can observe important differences in the distribution of words between, for example, speech and writing, or between different types of speech (e.g., monologue versus dialogue). In the British National Corpus (BNC—a collection of 100 million words of data, of which 10 million are spoken), the noun *kids* is twice as frequent in the spoken segment of the corpus as in the written fiction segment, and almost twenty times more frequent than in the written academic segment. The noun *children* is much more evenly distributed across the three datasets. Conversely, a frequency list can tell us what words are rare in spoken language; for example, the words *vicarious* and *simulacrum*, which occur in academic writing, occur nowhere in the spoken BNC. For further information on the different distributions of words in the BNC, see Leech, Rayson, and Wilson (2001).

It is not only single words that can be analyzed in a corpus, and good software will reveal that spoken language manifests a huge number of ready-made “chunks” (strings of two or more words sometimes referred to as *n-grams*, *lexical bundles*, *lexical phrases*, *clusters*, *multiword units*) which speakers use repeatedly, enabling fast retrieval of items from the mental lexicon and making possible the steady flow of language we associate with fluency (Biber, Johansson, Leech, Conrad, & Finegan, 1999; Carter & McCarthy, 2006; O’Keeffe, McCarthy, & Carter, 2007; Cheng, Greaves, Sinclair, & Warren, 2009; McCarthy, 2010; Greaves & Warren, 2010). The analyst can usually choose the length of the chunks he/she wants the software to retrieve from the data (e.g., all the repeated three-word chunks, or four-word chunks). O’Keeffe et al. (2007) give lists of common chunks and idiomatic expressions in British and North American English spoken data. These lists reveal that the most common chunks (such as *you know*, *I mean*, *that kind of thing*) are highly interactive and paint a clear picture of how speakers take one another into account and work hard to create satisfactory personal relations (see McCarthy & Carter, 2002; see also Shin & Nation, 2008; Martinez & Schmitt, in press). The spoken segment of the American National Corpus (first release) includes in its list of most common three-word chunks *was nice talking*, *I understand that*, *all that stuff*, and *what would you* (to consult frequency data from the American National Corpus, see www.americannationalcorpus.org/frequency.html#).

Other analytical instruments based on word-frequency lists include collocation tools which gauge the likelihood of two words occurring together and then measure the actual co-occurrence and give to the collocation a statistical score of significance. In the case of the spoken language, this may again reveal interesting contrasts both between speech and writing and between different forms of spoken language. In the BNC, for example, the most immediate noun-collocates of the adjective *difficult* in the written academic segment are *question, task, problem, and concept*, while *question, situation, job, and time* dominate the spoken list, revealing the different preoccupations and priorities that occur in speech as compared with academic writing. Another useful technique is to examine keywords, that is to say words which occur with unusual frequency in one corpus or another. McCarthy and Handford (2004) show that the verb *need* is a keyword in spoken business English, and trace its unusually high frequency to its common use in the chunk *we need to*, denoting corporate exigencies and indicating a way of hedging directives by expressing them as collective requirements (i.e., *we need to* said by a senior or powerful person in an organization may be interpreted by subordinates as *you must/should*). By contrast, *can* is the highest ranking modal verb among the top 20 keywords in a corpus of spoken academic English collected in universities in Ireland (LI-BEL, see Walsh, Morton, & O’Keeffe, 2011). This is attributed to its instructional use in this pedagogical context, for example, *can you tell me, can you think of*.

Perhaps the most useful and revealing tool for any corpus linguist is the concordance, a computer screen display or printout of a chosen word or phrase in use in numerous different contexts by numerous different users. For spoken language, the concordance can bring together the utterances of many different speakers over many different places and occasions of use, giving to the researcher a powerful instrument for gauging what is typical usage and in what contexts things are said. Most concordance software allows a variable range of context to be viewed, from a single line of text across the screen with the key word(s) centered vertically, to a longer context such as a whole speaker turn. For instance, when exploring concordance lines for the keyword *can* referred to above in the spoken academic corpus LI-BEL, the pattern *can + actually* becomes instantly visible once the words that occur after the search word, *can*, are “right-sorted” alphabetically, that is to say all the words beginning with *a-* (such as *actually*) are shown first, then *b-*, and so on (Figure 1). The researcher can then identify, by going back to the source files for extended context, that *can + actually* is associated with the marking of new information by lecturers.

And you can actually do it you can actually do it through what should I say amm
have a history of tuberculosis you can actually be refused entry into other states. It’s
have it out of synch then maybe we can actually build in that delay as well. So that both

Exploiting Distinctive Features of Spoken Corpora

Because written data used in the service of writing dictionaries for so long dominated the study of corpora, linguists tended to focus on words, phrases, and grammatical phenomena in texts. However, as we have already noted above, a transcript may contain a wealth of nonword information (the tags and other conventions we have already looked at) which the spoken corpus analyst can exploit better to understand how common events such as conversations are formulated. We noted that individual speakers were usually designated by a symbol (e.g., a dollar sign with a speaker number). Computer software is impartial to words or nonwords and can be instructed either to ignore such speaker tags (if we are only interested in the words uttered) or to search for them and count them, just like words. This latter option enables researchers to learn a lot about how speakers construct their turns at talk, and can offer powerful quantitative underpinning to the microanalyses of individual conversations provided by researchers working in the conversation analysis (CA) tradition. Simple statistical operations such as counting how many turns take place in a conversation, or what the average number of words per turn is, can provide important insights into particular types of conversations or to talk as a whole. Tao (2003) takes the exploitation of speaker tags further, and provides a frequency list of turn-openers, the first words after speaker tags, as evidenced in a corpus of spoken American English. The words which characteristically open turns are freestanding items such as *yes*, *so*, *right*, *well*, and so on, and they show us that turn-openers predominantly attend to what the speaker has just heard, providing a linking function and contributing to confluence by creating smooth transitions from one turn to the next.

Figure 2 shows part of a concordance for a speaker tag <\$*> + *well* (where * is a “wild-card” representing any character) in the five-million word CANCODE spoken corpus. (CANCODE means Cambridge and Nottingham Corpus of Discourse in English. Cambridge University Press is the sole copyright holder. For details of the corpus, see McCarthy, 1998.) The data has been right-sorted.

<\$E> sound of till <\\$E> Now seventy eight so please. <\$E> pause <\\$E> Thank you very

Figure 3 Extract from concordance lines for *now* in shop recordings from the Limerick Corpus of Irish English (LCIE)

We see here from the tags immediately before it that *well* frequently begins a speaker's turn, and that *well actually* is a frequent chunk: we do not find *actually well* occurring anywhere in the concordance. Some software allows case-sensitive searching, which would enable us to distinguish *Well* from *well*, making it easier to find turn-opening examples if the transcribers followed the convention of using a capital letter at the start of a turn. With most software too, by clicking on any line in the concordance, we can get back at once to the whole text of the conversation to access more context and work out the situations in which people typically respond with *Well actually*.

Another example comes from a subcorpus of grocery shop recordings from the LCIE corpus, where the high frequency discourse marker *now* is frequently preceded by the tags <\$E> and <\\$E>, used to add extralinguistic information (Figure 3). The extralinguistic information in all cases is the sound of the cash register as money is handed over, annotated as <\$E> *sound of till* <\\$E>. This allows us to see the contextual pattern whereby the shop attendant rings up the price of the customer's item on the till, and the attendant announces the price of the item to the customer, always preceded by the discourse marker *now*.

Another approach to identifying the distinctive features of spoken language is to compare word and (two to six word) chunk frequencies with a written corpus. This often brings to light how the real-time interactivity of spoken language affects the profile of high frequency words and chunks in spoken corpora. O'Keeffe et al. (2007) discuss this in great detail and show how pragmatic functions of spoken language lie behind many of the high frequency items:

Function	Example
Discourse marking	<i>you know, I mean, You know what I mean, At the end of the day</i>
Face and politeness	<i>Do you want me to, I don't know if, Would you mind?</i>
Vagueness and approximation	<i>and stuff like that, and so on, and things like that, a couple of</i>

By isolating words and chunks from specific spoken context an even more refined profile emerges. For example, in a 30,000-word collection of English Language classroom data (a subcorpus of the Limerick-Belfast Corpus of Academic Spoken English—LI-BEL CASE), we find the top 30 most frequent three-word items (see Table 1).

Table 1 Thirty most frequent three-word units in ELT classes taken from LI-BEL

1	I'm going to	16	do you want
2	what do you	17	look at the
3	We're going to	18	this is a
4	you want to	19	use a comma
5	going to do	20	what are you
6	I don't know	21	would like to
7	going to be	22	you have to
8	do you think	23	if you want
9	what did you	24	is going to
10	a lot of	25	not going to
11	I want you	26	we have a
12	did you do	27	you to do
13	want you to	28	you're going to
14	brother lives in	29	a little bit
15	are you going	30	at the end

Here we see evidence of more pragmatically specialized language patterns performing classroom-based speech acts and speech events:

Explaining	<i>I'm going to; we're going to; look at the; this is a; we have a;</i>
Instructing	<i>[I] want you to; look at the; use a comma; you have to; you're going to</i>
Questioning	<i>do you think; what did you; are you going; do you want; what are you</i>

Conclusion

Spoken corpora were for a long time seen as appendages to much larger written collections of data. They have moved beyond this status and, aided by digital technology, more and more are emerging. It is an exciting point as we move towards the next generation of spoken corpora. Many challenges still remain, such as the drudge and expense of transcription, and challenges of audiovisual alignment with transcripts (see Carter & Adolphs, 2008). Adolphs and Knight (2010) note that as advances in technology allow us to develop new kinds of spoken corpora, such as audiovisual data streams and much richer descriptions of contextual variables, it will become increasingly important to agree on conventions for recording and representing these kinds of data, and the associated metadata. Adherence to agreed conventions, according to Adolphs and Knight, especially when developing new kinds of multimodal and contextually enhanced spoken corpora, will significantly extend the scope of spoken corpus linguistics into the future.

Anthropological Linguistics

WILLIAM A. FOLEY

Anthropological linguistics is the subfield of linguistics (and anthropology) concerned with the place of language in its wider social and cultural context, its role in forging and sustaining cultural practices and social structures. While Duranti (2001) denies that a true field of anthropological linguistics exists, preferring the term linguistic anthropology to cover this subfield, I regard the two terms as interchangeable. With some cogency, Duranti (2001) argues that due to current concerns of mainstream linguistics with the explicit analysis of the formal structures of language in contrast to anthropology's broader approach of looking at how humans make meaning through semiotic systems in cultural practices, this subfield is properly included within anthropology rather than linguistics. However, I beg to differ, believing that the current historical divisions of academic turf are just that—historical and contingent—and subject to change, and I would be loath to institutionalize such divisions by insisting on rigidly labeled compartments. The current disciplinary concerns of linguistics do not reflect its earlier history in which it was firmly enjoined to anthropology (Boas, 1940; Sapir, 1949; Haas, 1977, 1978). It is my firm hope that, over time, this more inclusive view will reassert itself, and hence my preference is to use both terms to cover this subfield, although, as titled, I will stick with the label anthropological linguistics in this article.

Anthropological linguistics needs to be distinguished from a number of neighboring disciplines with overlapping interests; first, its close sister, sociolinguistics. Anthropological linguistics views language through the prism of the core anthropological concept, culture, and as such seeks to uncover the *meaning* behind the use, misuse, or non-use of language, its different forms, registers, and styles. It is an interpretive discipline, peeling away at language to find cultural understandings. Sociolinguistics, on the other hand, views language as a social institution, one of those institutions within which individuals and groups carry out social interaction. It seeks to discover how linguistic behavior patterns with respect to social groupings and correlates differences in linguistic behavior with the variables defining social groups, such as age, sex, class, race, and so on.

While this distinction is neither sharp nor absolute, it is useful and perhaps an example might help in establishing this. Consider the variable pronunciation of the progressive/gerundive ending, so that *running* can be pronounced [rʌnɪŋ] or [rʌnɪn] (informally described as “dropping the g,” i.e., “runnin”). If we approach this variable from a sociolinguistic perspective, we will note the correlation between each pronunciation and particular social groupings, for example, the higher frequency of the [ɪn] variant with male speakers, and [ɪŋ] with female speakers; or, again, the higher frequency of the [ɪn] variant with speakers of a working- or lower-class background, while higher frequencies of [ɪŋ] are correlated with middle- and upper-class backgrounds. Such would be a typical sociolinguistic approach (see, e.g., Labov, 1972). However, an anthropological linguistic approach, while taking note of all these correlations, would ask a further fundamental question: what do speakers mean when they use an [ɪn] versus an [ɪŋ] variant? Of course, the answer may vary in different contexts, but one possible answer, following Trudgill (1972), is that the use of [ɪn], considering its link to the social variables of maleness and the working class, could be an assertion of a strong masculine self-identity. Trudgill (1972) points out

that male, middle-class speakers in Norwich, Britain, often use variables like [In] to stake exactly this claim, regarding the values perceived to be associated with working-class life, such as toughness, struggles against the odds, and physical labor, as indicative of enhanced masculinity.

Because anthropological linguistics seeks to uncover the meaning behind the uses of language within culture, it also presents some overlap with semantics and pragmatics, particularly the latter. Again, without insisting on sharp boundaries, I would like to distinguish among these along the following lines. Semantics (Kearns, 2000; Reimer, 2010) is that subfield of linguistics that studies the meanings of signs, their interrelations and combinations, while pragmatics (Cummings, 2005), albeit a bit hazy in its own delimitations, investigates how speakers create meaning in context in ongoing acts of language use. In view of its definition offered above, anthropological linguistics can be contrasted with these two other fields by the central role that culture and cultural practices play in its descriptions. Consider the word *wampun* from the Yimas language of New Guinea, which can be described semantically as polysemous, with the meanings "heart, care, desire." A pragmatic description will investigate its various uses in differing contexts to determine what extended meanings it can take on in appropriate contextual frames. But an anthropological linguistic description would go farther and explore how this word is central in indigenous conceptualizations of morality and cultural practices of reciprocal gift exchange. Linguistic expressions and metaphors for culturally valorized practices related to generosity and exchange are built on this word (see Kulick, 1992 for similar data). Finally, a detailed anthropological linguistic study will uncover the cultural beliefs and practices which account for why this word has the polysemous meanings it does; what, for instance, connects "heart" with "care" in indigenous ideology?

Humans are by definition social beings and, as emphasized by Geertz (1973), largely fashioned by culture. Culture is transmitted and society reproduced by ongoing interaction between persons. What people do in such ongoing interactions is make meanings, and this process is what we call communication. Cultural practices, then, are nothing other than processes of communication that have become recurrent and stable and hence transmitted across generations, and in so doing, they become pre-reflective practical ways of doing things, a *habitus* (Bourdieu, 1977, 1990). Anthropological linguistics, then, studies how humans employ these communicative cultural practices, or *semiotic* practices, as resources to forge large and small, transient or permanent social groups. In an insightful overview, Enfield and Levinson (2006) argue that all such communicative practices occur at three levels. The first is an individual-based "interaction engine." This is where concerns of anthropological linguistics overlap with cognitive psychology. The "interaction engine" consists of the cognitive and biological abilities that underlie our capacity to communicate, such as the capability to interpret the intentions and mental states of others (the so-called "Theory of Mind"; Carruthers & Smith, 1996). Such substrates make all human communication possible. The second is the interpersonal "interaction matrix." This is an emergent level of behavior formed by coordinated practices of social actors, much of it culturally shaped and habitual, although there are clearly panhuman aspects as well. Examples include turn-taking in conversations and other mechanisms studied in conversational analysis (Atkinson & Heritage, 1984; Sacks, 1992; Sidnell, 2001). Finally, level three is the sociocultural level proper. Included here are the culturally mandated routines or rituals in which particular types of linguistic practices are selected and sanctioned, such as courtroom summations, divination rituals, political oratory, or barroom chitchat. This is the conventional domain for the notions of register and genre, although the interpersonal moves which actually construct a particular register are features of level two, and the cognitive underpinnings which allow us to interpret the intentions of the speaker in using a particular register belong to level one.

We can usefully look at much of the research work done in anthropological linguistics under the banners provided by this schema of the three levels. The breadth of work in this subfield is enormous, and space will only permit the exploration of a few key illustrative areas. Perhaps the most persistently fascinating area within it has been the question of linguistic relativity, whether features of the language we speak influence our cognition. This is a question that spans levels one and three: whether deeply sedimented features of our conventional publicly shared language developed and transmitted over generations (level three) influence the way we cognize the world, make inferences, or remember information (level one). While this has been an area of vigorous speculation over the centuries, nothing amounting to serious empirical work emerged until recently, and here the focus will be on some pioneering work on the language and cognition of space. Earlier work on spatial cognition assumed it to be strongly informed by innate, presumably biologically based, universals, so that it is essentially the same in all languages and cultures. Given these universal conditions and our ecological niche as terrestrial, diurnal creatures, it is claimed that we are predisposed to conceive of space in relativistic and egocentric terms, projecting out from the anatomical patterns of our bodies. Thus, the coordinates through which spatial orientation are established are projected from ego, the deictic, central reference point for all spatial reckoning, along two horizontal axes and one vertical. The vertical one, drawn from our upright position or, perhaps, the experience of gravity establishes the UP-DOWN axis; the horizontal axes are FRONT-BACK, derived from the anatomically asymmetrical division of the body into two halves, and LEFT-RIGHT, from the symmetrical division. The location of objects in space, then, is always determined relative to the orientation of the speaker: if we are standing eye to eye across from each other, my left is your right. There are no fixed, absolute angles used in human spatial orientation.

Recent research has shown these assumptions to be unfounded. Languages (and speakers) actually differ as to whether they employ this speaker-centered relative system of LEFT-RIGHT, FRONT-BACK, or an absolute system based on fixed parameters of geographical space like the cardinal directions or landward/seaward or upriver/downriver. Such absolute systems are in fact very common and occur in Aboriginal Australia, Oceania, and Mesoamerica. A particularly striking example is Guugu-Yimidhirr, of northeastern Australia. This language completely lacks all spatial terms which are relative to body orientation; in particular there are no terms for locating the position of objects in space equivalent to FRONT, BACK, LEFT, RIGHT (e.g., the latter two terms can only be used to refer to the left and right hands and perhaps other symmetrical body parts, like eyes, legs, etc.). Rather, the language heavily employs four words, corresponding roughly to the four cardinal directions. The astounding thing about languages like Guugu-Yimidhirr is that these absolutely based terms are habitually used by speakers to describe location or motion. It is as if in response to the question "Where's the salt?" I responded, "It's there, to the east." In the relativistic, egocentric spatial universe of the English speaker, this is likely to provide little enlightenment and lead to a puzzled look or worse, but this is exactly how a Guugu-Yimidhirr speaker would respond.

Levinson (2003) is a careful, empirical study investigating the core claim of linguistic relativity with respect to Guugu-Yimidhirr, amongst other languages: does the system of spatial categories in that language influence the way its speakers cognize space, as determined by tests that probe spatial reasoning and memory tasks? A number of experiments were carried out testing Dutch speakers in these tasks, who have a relative system of LEFT-RIGHT, FRONT-BACK like English with Guugu-Yimidhirr speakers, and in each case, there were marked differences in the response of the two groups to stimuli. Such results strongly suggest differences in cognition, as measured by differences in memory and reasoning, and these are closely correlated to the different linguistic systems for talking about space in the languages of the two groups of subjects. For instance, in a simple

recall experiment a table facing north was laid out with a line-up of three toy animals, all facing one direction, say east and to the right. The subject was asked to remember it, and it was then destroyed. He was then led into another room, with a table facing south and asked to reproduce the alignment. If he does this task absolutely, he will set up the line facing east, but this time to the left. If, on the other hand, he does it relatively, the line will be set up facing right, but to the west. Results for this test were in line with predictions from the hypothesis of linguistic relativity: nine out of 15 of Guugu-Yimidhrr subjects preserved the absolute eastward alignment of the array, while 13 of 15 Dutch control subjects preserved the relative rightward alignment.

Ways of expressing politeness in language is another domain in which researchers in anthropological linguistics have been active. Politeness is essentially a field in which cultural ideologies about personhood and social roles (level three) are enacted in prescribed rituals and formulas of social interaction between persons (level two). The person may be "inscribed" (Gergen, 1990) in social relationships (level two), but the kind of person he or she can be is determined by macronotions of what are their proper rights and obligations and how these are articulated in the wider sociocultural sphere (level three). Politeness forms in language are the recognition of differential rights and duties amongst the interactants in a social encounter. Typically, those of higher rank are recognized as such through the use of politeness forms by those in lower rank. Rank is mainly established by rights and duties: those of higher rank have rights over those of lower rank, who, in turn, often have duties to those in higher rank, although in many cases higher rank can bring concomitant duties as well. Consider the elaborate ritual of greetings among the Wolof of Senegal (Irvine, 1974) and how their cultural ideology of social inequality is enacted in its performance. A clue is provided by an insightful Wolof proverb about greetings: "When two persons greet each other, one has shame, the other has glory" (Irvine, 1974, p. 175). Wolof is a stratified Muslim society, and greeting rituals are used as a way of negotiating relative social status amongst the interlocutors. The basic dichotomy in Wolof society is between nobles and commoners. The local ideology associates lower status with both physical activity (i.e., movement, and speech activity). Higher-status people are associated with passivity. Because of this, it is the lower-status person who initiates the greeting encounter, by moving toward the higher-status person and beginning the ritual greeting. As a consequence, any two persons in a greeting encounter must place themselves in an unequal ranking and must come to some understanding of what this ranking is; the simple choice of initiating a greeting is a statement of relatively lower status. The form of a greeting encounter is highly conventionalized. It consists of salutations, questions about the other party and his household, and praising God. The more active, lower-status person poses questions to the higher-status one, who in a typical higher-status, passive role simply responds, but poses none of his own. In addition to the typical speech acts performed and their roles in turn-taking, the interactants are also ideally distinguished in terms of the nonsegmental phonological features of their speech. Correlated to the activity associated with lower status, the greeting initiator will speak a lot, rapidly, loudly, and with a higher pitch. The recipient of the greeting, on the other hand, being more passive and detached, will be terse, responding briefly and slowly to questions posed in a quite low-pitched voice. The distinct linguistic practices associated with the interlocutors in a Wolof greeting encounter are linked to the kinds of persons they are. The greeting ritual both enacts the cultural ideology of inequality amongst persons in Wolof and reproduces it every time it is enacted. The linguistic forms used, polite or otherwise, index the kind of persons the interactants are, just as they construct and reconstruct this ideology at every mention.

A final area of research to illustrate the typical concerns of anthropological linguists is the cultural performance of verbal art, or more specifically, culturally valued genre types.

Certain social roles, typically those of higher social status, are marked by their control of particular, also highly valued, genres; think of how a priest is determined by his control of the liturgy, or the shaman by her spells, or even a successful barrister by her stirring summation oratory. The study of genres is clearly a core specialty of this subfield and belongs squarely to level three, the sociocultural matrix. Genres are prototypical cultural practices; they are historically transmitted, relatively stable frameworks for orienting the production and interpretation of discourse. In a word, they are “institutionalized.” The capacity to produce and detect genres as models for discourse comes from their “framing devices” (Bateson, 1974) or “contextualization cues” (Gumperz, 1982), such as *once upon a time* for a fairy tale or citations for an academic paper. Such framing devices work to the extent that genres are not so much inherent in the text forms themselves, but in the frameworks and interpretive procedures that verbal performers and their audience use to produce and understand these texts. Genre classifications are not rigidly definable in terms of formal text types, but are the result of applying (sometimes conflicting) interpretive procedures indexed by the framing devices employed.

Framing devices are features of the poetic function (Jakobson, 1960) of language, formal linguistic principles for the enaction of diverse genre types, such as line final rhyme for certain genres of English poetry, like sonnets. Various types of framing devices include special formulas or lexical items, tropes like metaphor or metonymy, paralinguistic features, like drums or singing, and, most importantly, parallelism. This last is recurring patterns in successive sections of text and can be found at all levels of the linguistic system, phonology (rhyme and rhythm), grammatical (repeated phrases or clauses), and lexical (paired words). Genres do not exist as abstract categories, but only as schemes of interpretation and construction, which are enacted in particular performances. Genres can be recontextualized from earlier contexts to new ones with a greater or lesser shift in their interpretation. This opens a gap between the actual performance and the abstract generic model we might have of it from earlier performances. This gap can be strategically manipulated by performers to convey comments about current social happenings or valuations of cultural traditions (Briggs & Bauman, 1992).

Anticipatory Discourse

INGRID DE SAINT-GEORGES

Researchers interested in anticipatory discourse are, generally speaking, concerned with discourses in or about the future. They investigate how individuals, texts, or utterances project representations of future events, states, or relations. Unlike other areas of applied linguistics, the study of anticipatory discourse is still very much in its infancy. As yet, there is no set tradition or school for the study of such discourse, even if it has often been linked with critical discourse analysis. Given this state of affairs, this article focuses on research by authors who take the study of futurity as central to their work, although not all of them designate this work as “anticipatory discourse.” The study of anticipatory discourse thus makes a central claim: futurity is an inevitable component of text, talk, and more largely of social life, because human action has an intrinsically forward-looking nature. The study of anticipatory discourse thus proposes to add to the existing body of knowledge in discourse analysis by casting light on this future dimension of text and interaction.

With its focus on the future, the study of anticipatory discourse contrasts with the more well-known field of narrative studies, which has traditionally focused on the recounting of the past and on the historical processes through which events, identities, and actions come to be constructed. Even in this field, however, a number of authors have noted that narratives can be used in reference to the future as well as to the past. For example, research has shown that recollections of the past can be an opportunity for interlocutors to think about what might, could, should, or should not happen in the future (Ochs, 1994). Recounting of past events can also be used as a tactic for co-opting interlocutors into performing actions at a future point in time (Goodwin, 1990). Alternatively, such recollections may serve to explore innovative solutions to old problems or situations (Al Zidjaly, 2006). As used in the more general field of discourse analysis, however, the study of anticipatory discourse typically encompasses a range of linguistic phenomena besides narratives. It potentially includes research on any forward-looking behaviors, such as intention, action, planning, negotiating, decision making, and so forth.

Origin and Scope

The term “anticipatory discourse” was first coined by Scollon and Scollon (2000), who proposed that a theory of anticipatory discourse should be developed as part of a more general theory of human action and agency (see also Scollon, 2001; Scollon & Scollon, 2004). The authors’ initial goal was to contribute to an understanding of how individuals take action, how they use discourse and texts to do so, and how (discursive) actions might have the performative function of producing changes in the world. Because social actors predominantly act in anticipation of outcomes, Scollon and Scollon (2000) argued that the work of discourse analysts should adopt a future-oriented perspective, in order to do justice to the actors’ perspective at the moment of acting. From their work, several features of anticipatory discourse can be highlighted (Scollon & Scollon, 2000), although not all researchers adopt the same way of defining anticipatory discourse. Depending on the researcher’s orientation, one or more of the following aspects are generally emphasized:

2 ANTICIPATORY DISCOURSE

1. First, anticipatory discourse can be defined as the study of texts or utterances that are oriented toward future events, actions, or states.
2. Second, the study of anticipatory discourse is often concerned with discursive strategies which open or shut down particular lines of action at particular moments for particular individuals or social groups.
3. Third, analyzing anticipatory discourse usually involves paying attention to the stances constructed in text and talk regarding two domains: (a) *knowledge* and (b) *agency* asserted in future-oriented propositions:
 - (a) Because the future is the domain of what has not yet happened, any statement about the future should, in theory, be hypothetical and marked by epistemic uncertainty, as events can always intervene to derail even the most predictable course of action. In reality, however, speakers have the broader choice of presenting future states of affairs not only as hypothetical, but also as if they were knowable or already known. Because of this, part of the analyst's work is to identify what claims are being made with regard to knowledge of the future, and, more importantly, to investigate for what purposes these claims are being constructed.
 - (b) In terms of agency, anticipatory discourse not only reflects how much a speaker feels "in the know" about the future, but also reveals how empowered that speaker feels to act and affect situations to come. Hence, another part of the analyst's work is to investigate whether the speaker's position is portrayed as agentive or fatalistic, regarding the possibility of bringing about a particular outcome at a subsequent point in time.

With this context in mind, then, studying anticipatory discourse amounts to an examination of where the cursor is placed on the knowledge axis (from oracular to agnostic) and on the agency axis (from fatalistic to agentive) in constructing stances about the future (Scollon & Scollon, 2000). Within a critical discourse analysis perspective, this study also includes consideration of who gets to be the primary definer of the future, how it gets to be defined, and what power relations are involved in this definition.

From an analytical point of view, the study of anticipatory discourse often covers a variety of phenomena, ranging from the linguistic structures involved in constructing future representations to the social processes and practices that constitute specific "horizons" for action at a particular time for a particular individual or group. As such, the focus of anticipatory discourse research need not be limited to representations of the future as they are articulated in verbal communication. The analyst can also investigate cultural, material, or social structures and the extent to which they embody specific futures or make (im)possible certain courses of action. Whatever the perspective adopted, the researcher can draw from a variety of sources. For example, many areas of applied linguistics have provided important insights for the study of futurity. These have rarely been brought together as part of a more general theory of anticipatory discourse and are discussed below.

Conversation analysts, for instance, have identified numerous forms of verbal and non-verbal projection-related phenomena in interaction. Gestures, mimics, pre-sequences, pref-aces, and so forth can all be means of signaling upcoming actions to interlocutors, in order to give them a chance to anticipate a next turn or production, or to invite preferred turns or reactions (Streeck & Jordan, 2009). Researchers of pragmatics have provided detailed analyses of speech acts that are implicatives (e.g., forecasts, warnings, prescriptions, advice, orders, requests, etc.), as well as discourse markers that are cataphoric (which signal, for example, reorientation toward a new topic or subtopic, such as "so" or "now"). Research on verbal tense, mood, and modality as well as on linguistic and paralinguistic means of expressing (un)certainly (e.g., hedging, hypotheticals) reveals how a speaker might feel about future events (Fleischman, 1982). Studies of genre and rhetoric are likewise useful

for investigating future-oriented types of text (e.g., instructions, procedures, mission statements, policies, laws, fortune-telling, weather forecasting, etc.), and it is also worthwhile to examine how speakers make use of these genres to persuade interlocutors to adhere to some proposed course of action. On a macroscopic level, investigating anticipatory discourse entails consideration of larger-scale, future-oriented projections and how they come to constitute a horizon or matrix for possible actions (Sparke, 2000; Scollon, 2005). For example, the discourse of the slow food movement does not delimit the same kind of attitudes, actions, or daily consumption choices as the discourse of the globalized free market economy. Each of these discourses pre-shapes in part how individuals will position themselves with regard to the future. Finally, multimodal approaches to discourse can also be fruitfully utilized, in recognition of the fact that material structures also influence future behaviors and actions. For example, in a supermarket, the deliberate display of food, sales labels, and aisles converging toward the cashier is intended to generate certain responses from the shopper. This type of material incarnation that is designed to produce preferred lines of action constitutes a way of delimiting possible behaviors in the present or immediate future.

Regarding the domains that have so far been focused upon by researchers of anticipatory discourse, analyses of futurity in “news reporting,” “political discourse,” “health and counseling,” and “education and work” can be singled out. However, since anticipatory discourse is very much an emergent field, its scope should not be regarded as limited to these domains alone. The areas of investigation highlighted here should be viewed as a selection of important contributions to the field rather than an exhaustive review.

Media Discourse

The media is an important source of anticipatory discourse. Events such as upcoming elections, wars, trials, and so forth, the outcomes of which are not fixed or entirely predictable, generate their share of future-oriented discourse on the radio, on television, and in printed news. The reporting of these events requires careful managing of the uncertainty associated with them, and it is this very element of suspense which in part makes these events so newsworthy in the first place. Researchers have thus noted that news reporting often includes as much speculation as it does objective facts. Analysts of this type of anticipatory discourse have paid attention to how different groups comment on events to come (e.g., politicians, experts, media organizations, the general public, etc.), often to fulfill specific agendas or to maintain a plurality of scenarios (Jaworski & Fitzgerald, 2008). This research has focused on the status of assertions about the future and on the authority and reliability of the message (examining, for instance, *hedges*, *modality*, and *conjectures* in the presentation of news items) (Dunmire, 1997). These analysts have also studied *substitutive discourse*, which is the reporting that occurs when there is not yet reportable information, but there is a demand that events be reported with minimal time delay. This injunction to report events “as they are happening” often leads to the *manipulation of timeframes* (Jaworski, Fitzgerald, & Morris, 2003). Overall, this research has both described media practices and underlined some of the consequences for the democratic process, given how the present, past, and future are dealt with in the media.

Political Discourse

In the field of political discourse, researchers have proposed that an important part of politicians’ work is to project their vision of the future, notably through articulating the policies and decisions they plan to enforce (Dunmire, 2005). Moreover, the aim of politi-

cians' rhetoric is usually to enroll the general audience in sharing their positions. One important aspect of political discourse is that the views of the future presented are often consequential, in that the policies articulated may have practical consequences once adopted. They might even lead to wars. In this context, investigations of anticipatory discourse focus on the rhetorical mechanisms through which certain descriptions of the future are promoted over others, contributing to expanding one's area of control. Among the studies conducted, Dunmire (1997), for example, investigates how subjective perspective—representing the views of a few—can be transformed into objective, factual, almost commonsense reality by using linguistic strategies which erase clues indicating the source of the message, the uncertainty of the events presented, or the subjectivity of the view promoted. In the context of the 1990 Persian Gulf conflict, Dunmire's research discusses how, as some futures are presented as inevitable, alternative descriptions disappear, and contexts are created for particular actions and policies (1997). Another line of research has examined how major political changes, because they create unpredictable futures for some of the population, often move individuals caught in these changes toward new learning and improvisation (Scollon, 2001). Overall, research on futurity in political discourse has sought to make visible the ideological stakes intertwined with representing and projecting particular futures.

Health and Counseling

Another area concerned with the study of anticipatory discourse is the field of health and counseling. Many communicative situations involving medical or health professionals have a link to future decisions and behaviors. For example, doctors not only diagnose illness and disease but also prescribe interventions and medications. They sometimes make prognoses about the likely evolution of a condition or about the consequences of medical choices. Counseling sessions, too, often involve conversations about difficult situations to come, such as in genetic counseling or in therapeutic exchanges of all kinds (Sarangi, 2002). Peräkylä (1993), for example, examines sessions between AIDS counselors and their clients, when the counselors need to prepare their clients for sometimes dreadful upcoming phases in their illness, including possible death caused by the virus. The study looks at the design of turns for introducing invocations of the "hostile future" and for creating a favorable environment for discussion. It also investigates the use of hypothetical questions to frame discussion about the unwanted future and explores how counselors, by emphasizing the hypothetical and conditional nature of these futures, manage the epistemological framework of their interventions. More broadly, Peräkylä's study investigates the function of future-oriented discourse in alleviating some of the psychological effects of living with the end in mind. Another line of research has focused on patients' control and agency. Al Zidjaly (2006), for example, documents the interactions between a quadriplegic man and his primary caregivers. She analyzes the verbal tactics he employs to lead others to carry out specific courses of action on his behalf and thus to retain some of his agency despite his handicap. Her study considers the use of "hypothetical future-oriented narratives" to explore best- or worst-case scenarios and to solicit help in fulfilling certain agendas.

Education and Work

Education and work are also fruitful terrains for the study of anticipatory discourse. Concerning education, the purpose of school is usually to prepare learners for future situations and circumstances, most of which are unknown at the time of learning. Curricula, for

example, are generally geared toward making available an ensemble of social, cultural, technical, and linguistic resources meant to facilitate successful trajectories into the future, even when the specifics of that future remain unknown (Kress, 1996). Detailed studies of learning and training contexts have shown, however, that not only do representations of “successful trajectories” vary among the stakeholders involved in the educational process (trainers, learners, institutions, etc.), but also educational practices often serve to exclude or include participation in future contexts (de Saint-Georges, 2008). Some researchers have thus opted to examine “both ends of the trajectory”—not only preparing learners for future circumstances but also adapting social circumstances so that they benefit those learners most likely to be excluded from them (O’Connor, 2008). In the field of workplace studies, although productive actions are always done in anticipation of some outcome, it is only indirectly that the question of anticipatory discourse has been addressed, through studying, for example, operational talk through which things get done (Neville, 2005) or negotiations and decision making in meetings and how these direct specific courses of action (Holmes & Stubbe, 2003). Another area of research has been document design and, in particular, the study of procedural texts (e.g., prescriptions or instructions) and their association with actual actions (Filliettaz, 2004).

Implications

As researchers begin to integrate the future dimension into their work, many of them find it necessary to stretch this work beyond the traditional boundaries of linguistic analysis. For example, the study of future-oriented discourse often involves an examination not only of unique instances of texts, as is generally the case in discourse analysis, but also of chains of texts constructed over the course of several speech events, in order to trace incremental processes of meaning construction (de Saint-Georges, 2005). Only by considering what actually happened at a given point in time can the researcher unveil whether the discourses previously articulated about that point in time were in sync with reality or not. Likewise, for several researchers the study of anticipatory discourse involves an exploration of how this discourse figures in the production of concrete actions (de Saint-Georges, 2005; Al Zidjaly, 2006). In this way, research on anticipatory discourse goes beyond the study of language alone, exploring the performative functions of communication (its annunciative and constitutive capacities) and not just its referential dimension (Dunmire, 2005). Moreover, the study of anticipatory discourse requires the development of ad hoc and, at times, innovative methodologies. Over time, authors have thus proposed all of the following: auto-ethnographies designed to access the researcher’s own intentions and orientations toward the future (Scollon, 2001); multisited ethnographies to trace how a discourse produced in one situation can lead to the performance of linked actions at another place and time (de Saint-Georges, 2005); and, finally, personal engagement by the researcher in actions which document the relationship between future-oriented discourse, agency, and processes of social change (Al Zidjaly, 2006). These methodologies have all added a more dynamic dimension to traditional approaches to discourse analysis. Finally, the study of anticipatory discourse raises in many cases “ethico-practical” questions (Reisigl & Wodak, 2001, p. 34). Because the future is up for the making, studying future-oriented discourse raises the ethical question of responsibility for foreseeable consequences to one’s actions (Adam & Groves, 2007). It is both this ethical dimension and the potentially performative dimension of anticipatory discourse which are responsible for the fact that the critical slant has been dominant in research on futurity, although other approaches to future matters in discourse are clearly possible.

Approaches to Second Language Vocabulary Teaching

SUHAD SONBUL

The current view of vocabulary knowledge is that of a complex construct covering a wide range of lexical items (individual words, word families, and various types of formulaic sequences) and involving various aspects. Nation (2001) developed the most comprehensive account of these aspects including the form/meaning link, grammatical function, associations, and register. Two main approaches have been proposed in the second language (L2) vocabulary teaching literature to develop this comprehensive knowledge: an explicit, direct approach and an indirect, incidental approach (i.e., learning vocabulary when the focus is on the lexical item to be learned versus learning as a by-product of any language activity, respectively). Rather than being in opposition, the two approaches are currently considered complementary. Initially, adopting an explicit approach to vocabulary instruction will help learners develop the discrete form/meaning link. Once this link is established, massive exposure to L2 texts can facilitate enhancing and consolidating vocabulary knowledge through the indirect approach. This entry will present an overview of these two main approaches to L2 vocabulary instruction and will demonstrate how they work together in an integrative manner.

The Direct/Explicit Approach to L2 Vocabulary Teaching

Many scholars in the field of vocabulary acquisition (e.g., Nation, 1990, 2001; Schmitt, 2000) have stressed the point that vocabulary learning is an incremental process taking place gradually over time starting with the form/meaning link (i.e., associating the L2 lexical item with its meaning) and going through different stages to develop the various aspects of vocabulary knowledge. To trigger this process most effectively in the L2 classroom, teachers can utilize various form-focused activities (in the field of vocabulary instruction, activities with a specific focus on the individual lexical item to be learned, either in or out of context). Choosing lexical items that should receive this explicit instruction has long been based on frequency lists (lists of lexical items ordered according to frequency of occurrence in the language) such as the “General Service List” (West, 1953) and the “Academic Word List” (Coxhead, 2000). Nation (1990) claims that high-frequency lexical items deserve more explicit focus than low-frequency ones since they occur in a wide range of texts (written and spoken) and are, hence, crucial for the accomplishment of various receptive and productive tasks.

Different methods have been proposed in the literature for communicating lexical meaning depending on the nature of the lexical item and the reason why it should be explained with the golden rules being precision and simplicity (Nation, 2001). These include:

- performing actions,
- showing objects,
- showing pictures or diagrams,
- defining in the first language (translation),
- defining in the second language (Nation, 2001, p. 85).

DOI: 10.1002/9781405198431.wbeal0034

In addition to these form-focused activities directed by the teacher, there are others that allow independent self-paced learning such as using “word cards” (cards with the L2 form on one side and its meaning on the other) and keeping a vocabulary notebook. Moreover, in the modern world, technology offers a number of possibilities for autonomous vocabulary learning. These include electronic dictionaries, corpora (i.e., electronic collections of authentic spoken and written texts), and multimedia resources (for an overview, see Groot, 2000). During these various form-focused activities, learners can use a range of strategies to commit lexical items to memory with the choice depending on learners’ preferences and their proficiency levels (Schmitt, 2000). Shallow strategies (e.g., memorization, repetition) do not involve complex processing of L2 input and might, thus, fit beginners. However, deep strategies such as the “Keyword Method” (i.e., drawing a mental image to associate the form of the lexical item with its meaning) might well suit intermediate and advanced learners who can cope with, and may even benefit from, the amount of input associated with such strategies (Cohen & Aphek, 1981).

Although the current state of the art in language teaching is task-based, meaning-focused learning (where the focus is on the overall communicative meaning rather than individual grammatical rules or lexical items), Nation (2001) provides convincing arguments why decontextualized form-focused activities might be useful in the L2 classroom. These include practicality, faster and stronger effects, wide applicability, and the sense of achievement they give to beginning L2 learners. On the basis of research evidence showing that more explicit L2 vocabulary tasks lead to higher levels of retention, Laufer and Hulstijn (2001) proposed *The Involvement Load Hypothesis*. According to this hypothesis, any lexical activity that leads to more involvement should lead to faster and more durable gains of vocabulary knowledge.

In spite of its clear efficiency, the direct approach to vocabulary instruction has serious limitations related to time constraints and the complex nature of vocabulary knowledge. First, directly teaching all L2 lexical items is unfeasible. According to recent estimates (Nation, 2006), L2 learners need to know 8,000 word families (i.e., the root form plus its inflections and all regular derivations) to be able to read a wide range of authentic texts. Learning 8,000 root forms is in itself a daunting task, not to mention the various related forms within each family, which are not necessarily implied by knowledge of the base form (Schmitt & Zimmerman, 2002), and the various formulaic sequences associated with each item. Direct vocabulary instruction can only cover a fraction of this huge number of lexical items. Beside this major challenge, the different aspects of knowledge involved within each lexical item make the explicit teaching task almost impossible. Contextualized aspects of vocabulary knowledge, such as intuitions about register (formal/informal usage) and frequency, are not readily amenable to explicit instruction. Finally, even the most explicitly learned lexical item may be easily forgotten if not met several times in context. To sum up, any direct learning activity in the L2 classroom can be seen as a good starting point for L2 lexical development, but vocabulary instruction should not stop there.

The Indirect/Incidental Approach to L2 Vocabulary Teaching

To complement the explicit teaching approach and to overcome its limitations, incidental vocabulary learning should be facilitated through massive exposure to L2 texts. Incidental learning activities can have various receptive and productive forms such as extensive reading (i.e., reading long L2 texts when the main purpose is pleasure) and discussion groups. This indirect approach is particularly valuable in enhancing and consolidating the partial, explicitly learned lexical knowledge.

Early evidence for incidental vocabulary learning came mainly from first language vocabulary acquisition research (see, for example, Nagy, Herman, & Anderson, 1985).

Later, in a review article, Krashen (1989) extended this argument to second language learning even though his review included only three research studies focusing on L2 vocabulary acquisition. This led lexical researchers to start investigating unaided L2 vocabulary acquisition through reading. This research (e.g., Elley & Mangubhai, 1983; Waring & Takaki, 2003) has generally reached the conclusion that uninstructed L2 vocabulary acquisition is possible through reading, though only with small gains (few new form-meaning links built) and after repeated exposure (around ten times). Similar evidence comes from the few studies on incidental L2 vocabulary learning from listening (Ellis, Tanaka, & Yamazaki, 1994). Similarly, research comparing pure L2 incidental vocabulary learning to incidental learning aided by various explicit activities (e.g., Hulstijn, 1992; Sonbul & Schmitt, 2010) has shown the superiority (faster, greater, and more durable initial vocabulary gains) of the latter approach. Despite this obvious advantage of the explicit approach in developing initial knowledge of unknown L2 items (as discussed in the previous section), the essential and unique role of incidental vocabulary learning lies in enhancing known lexical items. A number of recent studies (e.g., Pigada & Schmitt, 2006) have shown that incidental learning opportunities are particularly valuable in enhancing and expanding existing lexical knowledge. When a known lexical item is met several times in context, learners start developing intuitions about various aspects of vocabulary knowledge, especially those not readily amenable to explicit instruction such as acceptable collocations and appropriate register.

In addition to its valuable enhancing role, the indirect approach has three other important benefits. First, the indirect approach has a major value in recycling and consolidating known lexical items. Nation (1990) argues that recycling is essential to L2 vocabulary development—even more important than teaching new items—since neglected old items might be easily forgotten soon after the learning session. To prevent this typical pattern of forgetting, carefully designed incidental learning activities can offer learners a wide range of opportunities to meet known lexical items in context. Second, through incidental learning strategies (e.g., inferencing and guessing from context), L2 learners might start developing knowledge of the low-frequency lexical items difficult to teach in limited classroom time. Finally, there is a motivational value in this approach as it facilitates self-learning and boosts pleasure and enthusiasm. If given the opportunity to choose reading materials, L2 learners will view extensive reading as a pleasant activity and will be motivated to read more and, hence, develop their lexical knowledge further (Thornbury, 2002). To conclude, any opportunity for incidental learning in the L2 classroom should not be viewed only as a supplementary activity, but also as an essential component of any vocabulary development program.

A Principled Scheme for Combining Direct and Indirect Approaches

The direct and indirect approaches to L2 vocabulary instruction work in synergy to facilitate vocabulary learning. Direct vocabulary teaching can be seen as a useful first step in the long journey of developing a large L2 lexical reservoir, but should be followed by contextual information provided through various classroom activities. Conversely, vocabulary met in context can always be usefully followed by explicit form-focused activities to strengthen the form/meaning link. Therefore, any vocabulary development program should keep the balance between the two approaches and see them as complementary rather than in tension. Although, the common practice in many L2 teaching contexts is to combine both approaches, this has not usually been done in any systematic manner. Nation (1996, 2001) proposes a principled and balanced L2 vocabulary development program comprising four main strands, each deserving roughly 25 percent of teaching time:

4 APPROACHES TO SECOND LANGUAGE VOCABULARY TEACHING

- meaning-focused input,
- language-focused (form-focused) learning,
- meaning-focused output,
- fluency development.

The minimum 25 percent devoted to form-focused vocabulary exercises in the scheme stresses the fact that implementing the traditional, explicit activities should not be the ultimate aim of the vocabulary lesson. Rather, considerable effort (50 percent of classroom time) should be dedicated to indirect, meaning-focused vocabulary learning activities (both input-based and output-based). Finally, the often neglected fluency development strand (i.e., activities helping learners to achieve fluency in using the lexical items they already know) should also receive no less than 25 percent of L2 vocabulary instruction. This is especially true in the EFL context where learners are not naturally provided with opportunities to practice language outside the classroom, and it is, thus, the job of the teacher to provide them with such opportunities. Nation (2001) stresses the importance of this fluency component without which vocabulary knowledge will be used only laboriously in real time. Keeping the balance between the four strands is indispensable if learners are to achieve an adequate mastery of L2 lexis.

Aptitude in Second Language Acquisition

PETER ROBINSON

Like height, intelligence quotient (IQ), or working-memory capacity, aptitude is measurable, and differs in degree between learners in any population. Unlike height, aptitude cannot be directly observed, but must be inferred from performance on psychological tests designed to measure it. Higher aptitude for second or foreign-language learning predicts more successful adaptation to instructed, or naturalistic exposure to the second language (L2), as measured by demonstrably faster progress in learning, and in higher levels of ultimate attainment in proficiency at the end of a course of instruction, or following a period of naturalistic exposure to the L2. Aptitude is therefore a *theoretical construct* (see Jordan, 2004), operationalized in the form of a test, which aims to predict *phenomena* that characterize second language acquisition (SLA) (such as incidental learning, metalinguistic awareness, fossilization, and others), and the extent to which successful SLA occurs as a result. Although little was known about these SLA phenomena during the period when aptitude tests were first developed (the 1930s to the 1950s), recent attempts to conceptualize and measure aptitude are addressing the extent to which tests of aptitude predict them—including for example, the extent of successful incidental L2 learning (Robinson, 2005a), metalinguistic awareness of the L2 (Roehr, 2008), and the influence of each on levels of ultimate L2 attainment (Abrahamsson & Hyltenstam, 2008). Some of these issues are described below, following a discussion of early developed conceptualizations, and measurement of aptitude for language learning.

The first tests of language-learning aptitude were developed in the early part of the 20th century (Symonds, 1930), at about the same time as tests of general intelligence were developed. These tests were developed largely in response to institutional and educational concerns which continue to influence proposals for operationalizing and using aptitude tests today. One of these concerns was to *select* those people best able to learn languages. For example, in many countries military and diplomatic personnel have to learn other languages. So to select those best able to do this, institutions such as the Defense Language Institute in the United States developed their own aptitude tests (Petersen & Al-Haik, 1976). Another reason for developing aptitude tests is to *diagnose* relative strengths and weaknesses in the abilities thought to contribute to language learning, so as to *differentiate* instruction and exposure to the L2 for individual learners in ways that optimally match their strengths in abilities, and compensate for areas of weakness (Robinson, 2007).

Perhaps the best known test of language learning aptitude, the Modern Language Aptitude Test (MLAT), was developed in the 1950s by John Carroll and Sidney Sapon (Carroll & Sapon, 1959). It is still used widely in SLA research into aptitude today, in its original (e.g., Robinson, 1997) and in translated versions (e.g., DeKeyser, 2000). Using this test, in the 1960s Carroll (1962) showed that students who were successful at learning Spanish and other L2s in schools in the United States were also, largely, those who scored high on the MLAT. The positive correlation between scores on this measure of aptitude, and scores on achievement tests in these programs, was reported as between 0.4 and 0.65. John Carroll argued that the MLAT predicted the *rate* or *speed* of foreign-language learning. He did not claim that those who scored low on aptitude tests could *never* reach high levels

2 APTITUDE IN SECOND LANGUAGE ACQUISITION

of ultimate attainment in the L2, but only that they would take *longer* to do this than those who scored high on his test.

Since the MLAT measure of aptitude is very similar to other, currently available tests that have been developed (e.g., Pimsleur, 1966; Petersen & Al-Haik, 1976), and is the measure most widely used, to date, in SLA research, I will describe it, and problems associated with it in some detail. The MLAT is a paper and pencil test, composed of five parts, and three of these are described below.

1. "Paired Associates" requires learners to memorize 24 foreign-language words, which are presented with their English translations. This measures what Carroll called "rote memory."
2. "Words in Sentences." There are 45 items of the following type. Given a sentence such as *Mary is cutting the APPLE*, which of the following underlined words performs the same grammatical function: *My brother John is hitting his dog with a big stick*. And the answer is "dog," the direct object. This measures what Carroll called "grammatical sensitivity."
3. "Phonetic Script" measures whether the person taking the test can match a nonsense word that they hear to its written form on a page. This measures what Carroll called "phonetic sensitivity."

Undoubtedly, being able to memorize foreign vocabulary, and understand grammar, and correctly identify sounds in a language you are studying are all very useful. If you are good at these you should do particularly well in L2 classrooms, because memorizing word meanings, understanding grammar, and correctly identify sounds are often assessed in measures of achievement—particularly those adopted in the audiolingual programs of instruction that were prevalent in the 1960s when the MLAT was developed. However, there are two major problems with the MLAT measure of aptitude:

1. Learning a language involves different abilities at different stages of *development*. The MLAT and other current aptitude tests don't measure these.
2. Learning a language takes place in many different situations and classroom contexts. The MLAT and other current aptitude tests are *insensitive* to these.

These problems of developmental and situational insensitivity are problems of construct validity. Aptitude tests like the MLAT don't actually measure the full range of abilities that contribute to language learning over time, and across settings in which L2 exposure can occur. They measure only a small number of the abilities that are drawn on during SLA. For example, what happens when we *begin* to learn a language? Obviously, we must develop a basic vocabulary. We do this by listening to, understanding the meaning of, and remembering new L2 words. The paired associates subtest of the MLAT measures this ability. We must also begin to understand the order in which words occur in sentences of the L2, and to understand other aspects of grammar. The words in sentences subtest measures this ability too. And finally we must correctly identify new L2 sounds we hear, and the phonetic sensitivity subtest measures this as well.

But what happens *after* these beginning stages of language learning? We must then use words, in the correct order, while speaking to, and managing interaction with others in the L2. There are many abilities for speaking and interacting in an L2, but the MLAT doesn't measure any of them. It has no measure of the ability to *produce* a language in speech or writing. But these abilities are important to *intermediate* success and progress in L2 learning. And at more *advanced* stages of L2 learning, often outside the classroom, we must learn how to *behave* appropriately in the L2, and learn the appropriate formal and

informal phrases and expressions needed at work, and when socializing. The MLAT doesn't measure the abilities for learning these. Based on these considerations Robinson (2005b) has argued that aptitude for language learning develops as the abilities drawn on in the initial stages of language learning reconfigure and are supplemented by abilities drawn on in later stages of learning. No current test of aptitude operationalizes this developmental perspective, though Robinson (2005b) has nominated clusters of abilities that should be important to aptitude for learning at beginning, intermediate, and advanced stages of L2 learning.

The second problem of *situational insensitivity* referred to above concerns the match between the abilities measured by an aptitude test, and the processing conditions under which learners are exposed to L2 input. For example, how do we learn new words or new grammar, or how to pronounce words in the L2? One way, of course, is to listen to a teacher explaining and demonstrating each of these, and then to remember and practice yourself. This is *explicit learning*: it is something you do intentionally and it requires effort and concentration. In contrast, children do not learn their first language (L1) in this way. Very young children have no explicit memory for the past. They have no long-term memory, and very limited short-term memory and attention spans. Consequently, children learn the patterns of the L1 *implicitly* and they are very sensitive to the frequencies with which forms co-occur (Saffran, Aslin, & Newport, 1996). They learn these co-occurring forms and patterns of language from exposure alone, and not as a result of explicit instruction.

There is no doubt that adults learn a lot of the L2 explicitly, by concentrating only on what they have to learn, and then later remembering it. But they also have the ability to learn the L2 *incidentally*, and this is closely related to child L1 implicit learning. Incidental learning is unintentional learning. You go to a birthday party, and next day you can remember names and faces of people you met there that you didn't know before. You read a book in the L2 and afterwards you know the meaning of some new words, but you didn't intend to learn them—you read the book to find out what happens to the main character.

In fact, many *situations* in which the L2 can be learned (like parties, the workplace, watching subtitled movies) require the abilities for incidental learning. One could argue that for advanced L2 learning, the ability to learn incidentally is particularly important. Some adults are good at learning the L2 incidentally, while others need more help in such situations. But the MLAT and other current aptitude tests don't measure ability for incidental learning. They measure only abilities for explicit, intentional learning. Robinson (1997, 2005a) showed that the paired associates, and words in sentences subtests of MLAT do not predict incidental L2 learning, though they do predict explicit instructed L2 learning, and correlate significantly and positively with measures of verbal intelligence. To this extent, measures of aptitude such as MLAT are situationally insensitive, predicting learning under explicit, but not incidental processing conditions.

Clearly, since the 1950s and 1960s when aptitude batteries such as the MLAT were first researched, piloted, and then published there has been a great deal of SLA research (see Ellis, 2008). These early aptitude batteries were developed without the benefit of findings from this research. Similarly, important psychological constructs and phenomena such as priming (Kinoshita & Lupker, 2003), task switching (Monsell, 2003), implicit, episodic, and working memory (Baddeley, 2007), were simply not conceived of, theorized and researched, at that time.

There is therefore a clear need to update our current theories, and measures, of aptitude, accommodating, where necessary, these recent findings from SLA and cognitive psychology research. Skehan (2002) has proposed such an updated theory of aptitude, proposing that processing input for meaning; organizing what has been heard and relating it to what is already known; and producing language in response to task demands, are three differ-

ent stages that correspond to different abilities and aptitudes for successful L2 learning and performance. Robinson (2002, 2007) has proposed a theory of aptitude describing how different clusters of cognitive abilities are related to learning from explicit instruction; incidental learning from written input, and from oral input; and from corrective recasting of output. For example, individual differences between learners in the extent to which prior exposure to a word or form “primes” and so speeds their subsequent recognition of it is proposed to be related to their success in incidental learning from speech or text. On the other hand, the ability to “switch” attention between the communicative content of speech, and a form made salient by recasting or input enhancement is proposed to be related to individual differences in task-switching abilities—those with better task-switching abilities being better able to process and learn the recast or enhanced form. Researching the issues raised by these more recent theories of aptitude is to be encouraged for the light this can cast on explanations of SLA phenomena, as well as for its potential relevance to pedagogy, and the issue of matching learner aptitudes to optimal conditions of instructional exposure.

Arabic Standardization

BRAHIM CHAKRANI

History of and Motivation for Arabic Standardization

Understanding the process of language standardization in the Arab world necessitates probing into the sociohistorical factors that motivate the attitudes that Arabs have toward their language. Records of the existence of standardized Arabic dates to the fifth century CE; yet it is unclear whether or not this standard is the literary outcome of many dialects or represents one particular dialect (Hourani, 2002). Local dialects of Arabic within the Arab peninsula contributed to the emergence of a standardized form of Arabic, called *fusha* (Standard Arabic [SA], literally “the eloquent language”). This resulted in an unprecedented amount of knowledge production, using the medium of SA.

Language for the Arabs played a central role in expressing and maintaining their cultural history and was regarded as the *diwan* (‘record’) of the entire speech community (Cachia, 2002). Some scholars have argued that due to the role Arabic came to play in the construction of the Arabic speech community, the members of that community possessed a more profound and intimate knowledge of their language than did speakers of other languages (Versteegh, 1997). Such in-depth knowledge and development of the language called for the restriction of borrowed words, which are considered *dakhila* (‘intruding’).

Standardization as a Means of Language Maintenance

With the expansion of the Muslim empire, many non-Arabs adopted Islam. These new Muslims quickly learned SA (Cachia, 2002) as an assertion of their new religious identity. This adoption represented an instance of positive linguistic assimilation with Arabs as they came into contact with local languages and cultures of the new converts (Mansour, 1993). Consequently, Arabic was not only the language of religion but also a literary and scientific language in the Arab world (Hourani, 2002).

Arabs noticed the introduction of *lahn* (‘deviant, divergent speech’) in the speech of the growing number of non-Arab Muslims. In addition, the expansion of the Muslim empire marked the beginning of the divergence between SA and spoken dialects of Arabic (Versteegh, 1997). In fact, the renowned scholar Ibn Khaldoun, considered by some scholars to be the father of sociology (Kalpakian, 2008), argued that Arabic standardization was introduced due to this divergence from Arabic speech norms. Ibn Khaldoun argued that grammatical rules for SA were introduced given the growing concern for the religious texts becoming incomprehensible due to potential language change, as these linguistic changes occur through hearing (Versteegh, 1997). Therefore, he maintained that Arabs’ codification of SA was able to reverse such divergence and maintain linguistic continuity.

The task of standardizing Arabic was given to the famous Arabic scholar Ad-Du’ali by the ruler of Basra, Ibn ‘abihi (Shehadeh, 2007), as well as to Sibawayh, a non-native Arabic speaker, considered the father of Arabic grammar (Versteegh, 1997) and whose influence on grammar continues today. Standardization stems from the need to preserve linguistic

2 ARABIC STANDARDIZATION

congruity and continuity of the Arabs with each other and with the past. In light of diverging dialects in the entire Arabic-speaking community, establishing the grammar of SA meant, for the Arabs, maintaining unity, conformity, and stability, rather than asserting linguistic difference.

Dialect Ideology

Access to understanding local Arabic dialects is only possible through the listener's ability to understand SA, as the link between these dialects can only be established through the attainment of the standard language. Greeting expressions such as Iraqi Arabic *Sh lunak?*, its Moroccan equivalent *La bas 'lik?*, or the Levantine expression *Kifak?* (all translated as 'How are you?') are all related to SA. These expressions would be unintelligible or morphophonologically opaque to speakers of other Arabic dialects, unless they possess access to the standard variety.

Many scholars have asserted the importance of investigation of the vernacular languages alongside the standard language in their function and use (Milroy & Milroy, 1999). However, given the diglossic nature of the Arab world (Ferguson, 2000) and due to the covert prestige Arabs attach to their local dialects, the vernacular languages in the Arabic context cannot substitute for the standard language. As with the Swiss German language situation (Watts, 1999), the standardization of any one dialect to the exclusion of others would constitute a disconnect from the wider Arabic-speaking community. Moreover, Arabs, due to their attachment to their local dialects, do not view the standardization of any local dialect, including their own, as capable of representing the entire Arabic-speaking community. In fact, in the 1930s, when a few Egyptians called for the standardization of the Egyptian dialect to replace SA in Egypt (Haeri, 2003), these calls were rejected by most Egyptians, given their attachment to SA and their desire for linguistic unity with the greater Arab community. Arabs view the relationship between SA and the dialects as that of richness and complementation, rather than conflict and opposition.

The Colonial Encounter

The recent colonial encounter of the Arab world with European countries and the contact of Arabic speakers with transplanted European languages have resulted in a linguistic domination of Western languages in the Arab world. The modernization of SA took shape through this language contact. Abdulaziz (1986) argues that the standardization process in the modernization of Modern Standard Arabic (MSA) meant an extensive lexical, morphological, and syntactic influence by and borrowing from Western donor languages, especially English. Colonial language policies in the Arab world led to the strengthening of standardization as an assertion of linguistic independence from the colonial powers (Tazi, 1986). In fact, the rise of Arab nationalism in the postcolonial context increased the need for Arabs to assert their linguistic identity, maintain their linguistic unity through MSA, and implement Arabization policies to assert the presence of SA in functional domains formerly allocated to European languages (Chakrani, 2010). With the standardization of SA and the increasing literacy rate, speakers from different parts of the Arab world are able, with a minimal education, to communicate using the standard language (Abdulaziz, 1986).

Assessing Multilingualism at School

GUUS EXTRA AND TON VALLEN

In this entry, the focus is on assessing both the home- and the school-language repertoires of multilingual school populations in a context of increasing cultural and linguistic diversity of societies and schools—due to processes of globalization and migration.

Assessing the Home-Language Repertoires of Multilingual School Populations

Demographic changes in increasingly multicultural societies have been documented in various ways. Poulain (2008) makes a distinction between nationwide censuses, administrative registers, and statistical surveys. Censuses take place at fixed intervals and result in nationwide databases. Administrative registers are commonly built up at the municipal level, accumulated at the national level, and updated every year. Statistical surveys may be carried out at regular intervals among particular subsets of population groups. Most census data on language use have been collected and analyzed in non-European English-dominant countries like Australia, Canada, and the USA. Most of the research is based on large-scale longitudinal analyses of (home) language use, maintenance, and shift toward English (Clyne, 2003). In Europe, such databases are less common, either because census practices are unfamiliar phenomena or because they do not include language questions (Extra, 2010). If available, non-mainstream language questions in European population research relate commonly to regional languages and rarely to immigrant languages. Finland is a European example with census practices on both types of languages. The UK for the first time has an inclusive question on languages other than English in its 2011 census.

Although an increasing number of school pupils make use of home languages that differ widely from the mainstream or “national” language, primary schools are rather reluctant to change their monolingual *habitus* (Gogolin, 1994). The status of community languages (a common concept in Australia and Canada) in mainstream education is very low, let alone the status of assessing community-language competences (Extra & Yağmur, 2004, pp. 379–92). Community languages are rarely part of mainstream education. If teaching takes place at all, this occurs commonly during out-of-school hours and on the initiative of concerned community members rather than educational authorities. Apart from English in non-English dominant countries, the mainstream language is commonly the only subject and medium of instruction. Educational responses and research focus on learning and teaching the mainstream language as a second language. Community languages are associated with language deficits and learning problems rather than with resources that could be exploited through education.

Against this background, the rationale for collecting, analyzing, and comparing home-language data on multicultural school populations derives from at least four perspectives (Extra & Yağmur, 2004, p. 112):

- Home-language data play a crucial role in the definition and identification of multicultural school populations.

2 ASSESSING MULTILINGUALISM AT SCHOOL

- Home-language data offer valuable insights into the distribution and vitality of home languages across different population groups, and thus raise public awareness of multilingualism.
- Home-language data are indispensable tools for educational planning and policies.
- Home-language data offer latent resources that can be built upon and developed in terms of economic opportunities.

Most of the research on assessing home-language repertoires of multicultural school populations has been carried out in urban/metropolitan areas. International migration and multilingualism are concentrated in such settings. The same holds for intergenerational processes of acculturation and language shift. Barni and Extra (2008) present case studies on mapping both regional and immigrant languages in Europe and abroad. In accordance with the distinction made earlier between census data, register data, and survey data, we will discuss prototypical examples of large-scale research on home-language repertoires derived from each of these three types of databases, reported by García and Fishman (1997/2002) for New York City, by Baker and Eversley (2000) for Greater London, and by Extra and Yağmur (2004) for six continental European cities.

García and Fishman (1997/2002) focus on how languages other than English (LOTE) have contributed to making New York City a culturally vibrant and linguistically diverse metropolis. Most research evidence is derived from census data on home-language use. The city's largest group of LOTE speakers is still Spanish-speaking. This holds also for NYC school populations, being, in decreasing order, of Puerto Rican, Dominican, and Mexican ancestry. According to census data from the year 2000, three out of five New Yorkers claim to use only English at home, and one out of five speak Spanish. Seven other home languages were reported by more than 50,000 New Yorkers: Chinese, Italian, French, Yiddish, Russian, Korean, and Greek. A total of 52 languages were reported by more than 1,000 speakers. García and Fishman discuss and compare census data from 1990, 1980, and decades before, on reported home languages, reported degree of bilingualism in English and LOTE of different ethnolinguistic groups, and processes of language maintenance and shift to English. In 1993/1994, there were 131 NYC public schools with bilingual programs in 12 different languages; 85% of the students were in Spanish–English programs in which Spanish was commonly taught only temporarily in transitional bilingual programs.

Baker and Eversley (2000) made a reanalysis of the data on home-language repertoires of pupils from public primary and secondary schools collected by the 33 Local Educational Authorities (LEA) in each of their districts in Greater London in 1998/1999. The cumulative database consists of 850,000 pupils' responses and generated more than 350 different home languages. The top five were English, followed at a distance by Bengali, Punjabi, Gujarati, and Hindi/Urdu, all of them originating from the Indian subcontinent. Computerized maps of the spread of the top 30 home languages in Greater London were composed using Geographic Information Systems techniques. Baker and Eversley gave a detailed account of all languages traced, and dealt with methodological issues in analyzing large-scale home-language databases. For complementary in-depth stories of multilingual identities in London we refer to Block (2005).

Extra and Yağmur (2004) report on the Multilingual Cities Project, carried out in Göteborg, Hamburg, The Hague, Brussels, Lyon, and Madrid. Aims of the project were to gather, analyze, and compare multiple data on the status of immigrant minority languages at home and at school, taken from cross-national and crosslinguistic perspectives. The total sample consists of 160,000 pupils' responses for an age range from 6 to 12 years. In analyzing the data, the regularly updated database of the *Ethnologue* (Lewis, 2009) on languages of the world proved to be very helpful. Apart from Madrid, the proportion of primary-school children in whose homes other languages were used next to or instead of the

mainstream language per city ranged from 30 to 50%. The total number of traced “other” languages per city ranged from 50 to 90%. The common pattern was that few languages were referred to frequently and many other languages only rarely. Children in all cities expressed a desire to learn a variety of languages not taught at school. Those children who took part in instruction in non-mainstream languages at school reported higher levels of literacy in these languages than children who did not take part in such instruction.

Assessing the School-Language Repertoire of Multilingual School Populations

Even though the last decades have shown an improvement in school results of second-generation immigrant pupils, these pupils still lag behind their majority peers in school success. Socioeconomic status, home language, ethnocultural background, and school characteristics are important indications for these different results. Few studies have investigated whether differences in test scores, rather than being determined solely by pupils’ efforts, might also partly be caused by the test instruments being used. If the mean scores of two subgroups of testees differ, such differences may be caused by differences in the skills to be measured or by specific characteristics of the measurement procedure (Gipps & Murphy, 1994).

If school-language proficiency and achievement tests are meant to differentiate between high- and low-achieving students, one must be sure that the scores of the two subgroups can be interpreted in a similar way. However, research has shown that many tests contain items that function differently for different subgroups, even when the students belonging to these subgroups have the same level of skills. This phenomenon is known as Differential Item Functioning (DIF). It occurs when students of different subgroups (e.g., native vs. non-native students of the mainstream language) do not have the same chances of answering a given test item correctly despite their equal skills in the construct to be measured and their comparable achievement level in a particular domain (Dorans & Holland, 1993). If answering a DIF item correctly requires skills or knowledge (e.g., specific school-language jargon) *other* than those intended to be measured (e.g., arithmetic), the result is unfair item bias (Camilli & Shepard, 1994).

Item-bias research is commonly carried out in three steps (Uiterwijk & Vallen, 2005). First, various statistical techniques are used to detect DIF items. Second, one needs to determine which element(s) in a DIF item may be the cause of DIF. Information has to be obtained from various relevant sources in different ways (e.g., not only by asking judgments from informants but also by conducting experiments such as Think-Aloud procedures and Rewrite procedures), since it is rather difficult to precisely identify the element that causes DIF. Third, one has to decide whether the possible DIF source is relevant to the construct the test claims to measure. If not, the item is biased and should be adapted or removed from the test.

As yet, little research has been done on DIF and item bias in Europe compared to the USA and Australia (McNamara, 1998). Differentiation between groups appears to be caused usually by socioeconomic status, gender, language background, and ethnocultural group membership. In most cases, the focus is on the statistical detection of DIF items only. Some researchers add subjective content analyses in order to find item characteristics that might be responsible for DIF. Controlled experiments to confirm or reject possible DIF sources in relation to the construct measured are rare. All DIF items are commonly removed from the test, although only biased DIF items are unfair to the tested subgroup(s) of students.

A combination of statistical DIF analyses, researcher and expert judgments, and controlled experiments has been applied in a research project with 180 language items, 180 mathematics items, and 180 information-processing items found in several Cito Final Tests of Primary

4 ASSESSING MULTILINGUALISM AT SCHOOL

Education in the Netherlands, all set in Dutch. The results of three subgroups of 12-year-old pupils were investigated: pupils whose parents interact (1) in Dutch, (2) in Turkish or Kurdish (henceforth Turkish students), and (3) in Arabic or Berber (henceforth Moroccan students). The focus was on linguistic sources of DIF and item bias (Uiterwijk & Vallen, 2003, 2005). The following mathematics item may serve as an example where a decision has to be made as to whether or not the item can be considered as biased on the basis of school-language use.

Father buys a sewing machine. The machine costs €800, VAT not included. The VAT is 20%. How much does Father have to pay including VAT?

A €160

B €640

C €820

D €960

Derived from statistical procedures, it turns out that the item shows DIF to the disadvantage of Turkish and Moroccan students. Expert judgments and controlled experiments provided strong evidence that the item would not have shown DIF if the question had been “What does Father have to pay with VAT?” Although language related, the phrase “including VAT” is not considered to be a central notion in mathematics teaching in primary education. Therefore, it is not part of the construct that the test aims to measure (knowledge of mathematics) and reduces the construct validity of the test: The item is biased and should therefore be adapted or removed.

In the different subtests of the Dutch Cito Final Test of Primary Education, the language subtests contain most DIF items. If linguistic elements that cause DIF belong to the language objectives of the education level, these items do what they should do and do not reduce the test’s construct validity. Even so, language items with DIF might be adapted or removed from a language test. Sometimes, reviewers agree that an element most probably responsible for linguistic DIF is actually part of the objectives of secondary rather than primary education. These items thus measure more than they are supposed to at the time and level of test administration.

With respect to the language-proficiency and achievement tests, researchers have to decide which DIF items are biased and which ones are not. The descriptions of the domains the items claim to measure turn out to be very informative and helpful in reaching a decision. While in the above-mentioned study 17% of all items show DIF, only 4% of these items are biased: 1.5% to the advantage of Turkish and Moroccan minority students and 2.5% to their disadvantage (Uiterwijk & Vallen, 2005). The latter can contribute to a less accurate prediction of secondary-school success and lower chances for admission and results at this educational level for non-native minority students than for native majority students.

Conclusion

The data presented in this entry originate from case studies on the assessment of both the home- and school-language repertoires of multilingual school populations. First, the focus has been on prototypical cross-national examples of large-scale research on home-language repertoires derived from different types of databases. Next, item-bias research has been addressed as a crucial ingredient in assessing the school-language repertoire of multilingual non-native speakers of this repertoire. The data presented on item bias originate from case studies on the Netherlands; similar phenomena have been reported in the cross-national studies referred to.

Assessment Across Languages

MARTYN CLARK

When assessing scholastic knowledge of students for international comparisons, assessment facilitators must be sure that the different language versions of the test assess the same content across all the language groups in the comparison. When an educational institution reviews its foreign-language curriculum and compares student progress in the different foreign-language classes offered, it needs to be sure that learners across languages are assessed against the same benchmark. In each of these situations, the same assessment needs to work across language populations. In the first situation, the language is irrelevant to the knowledge being assessed. For example, educational researchers may be interested in students' knowledge of biology in many parts of the world with diverse first languages and they therefore use a common test translated into multiple languages. In the second case, test users are interested in language ability itself, making it necessary to develop ways of comparing students' levels of language ability even when they are studying different languages.

Test Constructs and Construct Irrelevant Variance

The particular ability being assessed on a test is known as the *construct*. Examples of constructs are mathematical ability, the ability to describe the process of photosynthesis, or the ability to speak French. Testing specialists treat a construct being measured as a theoretically posited ability that is not directly observable and must be inferred from the performance of tasks that are intended to rely upon that ability for successful completion (Cronbach & Meehl, 1955). Thus, inferring a particular learner's ability to add two-digit numbers would most likely entail having that learner perform two-digit addition. Inferring ability to speak French would require the examinee speak French under defined conditions.

Because the goal of an assessment is to measure a person's ability with respect to a particular construct, it is vital that score differences on the assessment accurately reflect differences in ability related to the construct, rather than differences unrelated to that construct (AERA/APA/NCME, 1999). An overriding concern in any testing situation is to minimize construct irrelevant variance, the expression used for anything that affects a test score, but which is unrelated to the construct being measured. If the language used in a mathematical word problem is unknown to the student, for example, that student might not be able to understand the question itself, even though he or she possesses the mathematical ability that the question is attempting to measure. In this case, the language of the test question would introduce construct irrelevant variance into the test score. The student's success on that particular item may not be a reflection of the student's mathematical knowledge, as intended. The greater the construct irrelevant variance in a given assessment, the more suspect the student's test score becomes as a measure of the ability the test aims to measure.

The primary issue in assessing across languages, therefore, is to ensure that the various language versions of the assessment instrument are as free from construct irrelevant variance as possible. In cases where the construct of interest is not related to the language of the assessment, such as in international assessments of science ability or a satisfaction

survey given to hospital patrons of various backgrounds, the goal is to minimize or eliminate the effect of the particular language version of the assessment instrument on the resulting scores. In situations where the goal is to compare relative foreign-language ability across a variety of languages, then the goal is to ensure that similar scores on different language versions of the assessment represent similar levels of foreign-language ability, and not knowledge of the topics that the examinee is asked to speak about on the test, for example.

Adapting Content Tests Into Other Languages

Test adaptation to multiple languages is widely used in international comparisons of educational progress, such as the Trends in International Mathematics and Science Study (TIMSS) or the Program for International Student Assessment (PISA). Researchers also adapt questionnaires and surveys so that they can be used with subjects who do not speak the language of the original version. Political considerations may also play a role, and a particular region may have two or more official languages or language variants with the legal requirement that surveys and other assessment instruments be available in all official languages. In addition, legal rules for standardized testing of school subjects require special accommodations for students from a linguistic minority if they do not yet have sufficient command of the language of the test. In all of these situations, the goal is to minimize the effect of the language of the test on the measurement of the ability of interest.

Historically, several techniques have been employed to adapt content tests and surveys into other languages for use with populations who do not speak the language of the original version (Behling & Law, 2000). The most straightforward adaptation, a forward translation, assumes that a version of the test to be adapted already exists. A person fluent in both the language of the original instrument and the target language is employed to translate each of the items on the assessment instrument into the target language. If the text to be translated is relatively straightforward and consists mainly of simple instructions, then this type of translation can be effective. But if the instrument to be adapted relies more on the particular nuances of the language, such as a survey of attitudes toward education, then slight differences in the wording of the question between the original and translated version can influence the results in unintended ways across the different language versions of the instrument.

In cases where there are few available speakers of the target language and there are few other resources available, the forward translation method may be the only method available. The danger with this method is that there is very little in the way of quality control of the final translation. The ability to translate accurately from one language to another is a specialized skill, and merely knowing the two languages in question does not guarantee that the translated version of the test will be comparable to the original version. The bilingual translator is most likely bicultural as well, and there is no guarantee that the translated version will be appropriate for a monolingual audience of test takers. A preferred variation of this method is to include an expert review of the translation by another speaker competent in both languages (Geisinger, 1994). This review is especially critical in situations in which the assessment includes specialized terms, such as medical terms, which might not be familiar even to competent speakers of the language.

To overcome some of the problems with a single, forward translation, assessors employ a second technique called back translation. In this method, the test to be adapted goes through two rounds of translation. First, the text is translated from the original language into the target language, as in forward translation. Next, the translated text is re-translated into the original language by a second person who has no knowledge of the original text.

Areas of disagreement between the original text and the back-translated text can be scrutinized and rewritten to ensure that the important information of the original is maintained in the translated version. If needed, the process can be repeated several times until the definitive translation is created. Interviews in which participants are asked to verbally express what they are thinking while responding to different language versions of the assessment can help identify problematic items missed by translation.

Translation is not the only method available to develop content tests in multiple languages. Some researchers have investigated concurrent development of multiple language versions of the same assessment instrument (Solano-Flores, Trumbull, & Nelson-Barber, 2002). With this method, two or more versions of the assessment are created at the same time and following the same test specifications, an approach common in language proficiency assessment and discussed later. Concurrent development can be more time consuming, but it has some potential advantages over translation. Typically, translated versions of assessments do not go through the rigorous field testing and revision process of the original language version whereas concurrent development ensures that both language versions go through the same field testing and revision process.

It is often mistakenly assumed that adapted or translated items will be understood exactly as their original counterparts. It is important that this assumption be verified empirically. It is not enough merely to look at the average scores on the individual language versions of the test because lower scores for one language version versus the other may indicate actual differences across the language groups rather than inconsistencies across the versions of the test. Certain statistical techniques and research designs allow researchers to empirically verify that items across languages are behaving in the intended manner (Sireci, 1997). Many of these techniques fall under the label of differential item functioning (DIF). Although statistically complex, the basic idea behind DIF is relatively straightforward: For test takers of the same ability, there should be no statistically significant difference between items for different language groups. If a particular item is significantly easier or more difficult on a particular language version of the assessment, even when ability is held constant, then this suggests that there is something problematic with the item.

Even when due diligence is followed in creating multiple language versions of a test, caution must be exercised when interpreting test results. It is important for test score users to recognize that all test scores contain a certain amount of error. Test scores for individuals are best thought of as ranges around the final score, rather than single points. When comparing performance across different groups whose abilities have been assessed with different language versions of the same assessment, it is vital to recognize that small differences in scores may say more about an error in the test than the construct being assessed (Grisay, de Jong, Gebhardt, Berezner, & Halleux-Monseur, 2007).

The International Test Commission (ITC), established in the 1970s, promotes effective and appropriate testing practices. In 2000, the group produced a set of guidelines for adapting tests in response to the increasing use of assessments internationally (Hambleton & de Jong, 2003). These guidelines focus on the cultural context of the assessment, test development and adaptation, test administration, documentation, and score interpretation.

Assessing Language Ability Across Languages

Testing language ability across multiple languages can be seen as a special case of assessing across languages, and many of the issues discussed above apply. For example, PISA, an internationally standardized evaluation of the scholastic performance of 15-year-olds designed to help facilitate international comparisons of educational achievement, includes a reading literacy component that is developed through a process of rigorous test specifications,

text selection, translation, and cultural appropriateness considerations (McQueen & Mendelovits, 2003). Tests of foreign-language ability have also been created through a process of item-by-item translation (Clark, 1965). But most language educators in the communicative language teaching tradition believe that foreign-language assessments should focus on the examinee's ability to understand and use the language, and are uncomfortable with reducing test development for these purposes to the translation of existing instruments.

For this reason, assessments of language ability across languages often focus on the construct of second or foreign-language proficiency. Language proficiency can be defined as the ability to use a second or foreign-language to understand and create meaning for real-world purposes. These purposes may include tasks, defined as reading a novel in the original language of publication or successfully booking a room in a hotel. Other language uses can be defined abstractly, such as supporting an opinion that has been challenged or tailoring one's language appropriately for a delicate social situation. Regardless of the particular language being learned, learners can be evaluated based on their ability to perform the functions required for real-world language situations, and the results of those evaluations can be compared across languages. One way of framing such comparisons across languages is through the use of theoretical frameworks attempting to characterize this ability (e.g., Canale & Swain, 1980; Bachman & Palmer, 1996).

Another way is the use of one of the several language proficiency scales that have been developed to operationally describe the real-world functional ability of language learners with increasing levels of language proficiency. In the United States, the Foreign Service Institute/Interagency Language Roundtable (FSI/ILR) scale was developed in the 1950s to help define the language ability of government and military employees (Clark & Clifford, 1988). The FSI/ILR scale includes verbal descriptions of the typical language ability profile of a second or foreign-language speaker across five major proficiency levels, from 0 (no functional ability in the foreign language) to 5 (language ability equivalent to that of an educated native speaker). There are also "plus" levels between each of the major levels to indicate persons whose proficiency is considerably above the base level and able to perform some of the tasks indicative of the next higher proficiency level, but is unable to sustain performance at that higher level. Sets of descriptors were also developed for assessing listening, reading, and writing.

The FSI/ILR skill level descriptors are used across the more than 100 languages taught and tested in the US government. For the listening and reading skills, the descriptors are supplemented with a passage rating system based on text typology derived from an analysis of real world texts intended for native speakers (Child, 1987). This typology delineates increasing levels of textual complexity derived from four modes of language realization, ranging from concrete language for immediate use (such as traffic signs) to highly abstract and metaphorical uses (such as literary criticism). This typology is used to inform the content of reading and listening assessments based on the FSI/ILR system. Recently, skill level descriptors have also been developed for translation and interpretation, underscoring the distinction between general language proficiency and these more specialized skills. All of the skill level descriptors are intended to be language neutral and applicable to any foreign language.

The FSI/ILR scale was adapted in the 1980s for use in academic contexts by the Educational Testing Service (ETS) and the American Council on the Teaching of Foreign Languages (ACTFL) (Hiple, 1987). The adaptation included fleshing out the descriptions at the lower end of the scale, truncating the scale at the upper levels, and moving from a number-based labeling system to a more user-friendly labeling system for the level descriptions (novice-low to superior). These modifications were intended to make the scale more usable for the proficiency levels typically achieved by students studying foreign language in the United States.

Both the FSI/ILR and the ACTFL scales are often associated with an oral assessment protocol known as an oral proficiency interview (OPI), a cross-language technique used to assess proficiency. Oral proficiency interviews are intended to elicit language samples matching the descriptions in the proficiency scale by means of a standardized interview procedure conducted in the target language. Raters must be trained in proper elicitation techniques to obtain ratable samples of speech and to ensure that evidence for all important criteria for a given proficiency level are elicited. During the proficiency interview, the tester checks and probes the examinee's proficiency level in a conversational manner. Because the interview is not scripted ahead of time, the tester must consciously guide the discussion through questions that are intended to elicit particular features of the examinee's language. Careful training of testers is necessary if the interview is to be comparable across languages.

Although the ACTFL and FSI/ILR scales are used widely in the United States, other proficiency scales have been developed in other areas to standardize the descriptions of language ability across languages. The FSI/ILR scale provided the foundation for the Australian Second Language Proficiency Rating (ASLPR) (Ingram, 1990), later renamed the International Second Language Proficiency Rating (ISLPR). In Canada, the Canadian Language Benchmarks are intended to provide proficiency descriptions for both French and English ability (Pawlikowska-Smith, 2000).

In Europe, the Common European Framework of Reference (CEFR) has been very influential in providing a public framework to define language proficiency across languages (Council of Europe, 2001). This framework, from which specific proficiency scales can be developed, builds on previous projects that sought to identify the language functions needed to perform at various proficiency levels. The CEFR contains descriptors of what learners can accomplish with their language across three major levels, each with two sublevels, giving a range from basic proficiency (A1) to mastery (C2). Working from its own five-level proficiency scale, the Association of Language Testers of Europe (ALTE) created a set of self-assessment statements to study the relationship between student self-assessed proficiency and performance on ALTE members' exams. These statements, known as "can do" statements, focus on what the learner can do with the language, rather than points of deficiency, and are intended to help learners self-assess their developing proficiency. The ALTE statements have since been aligned with the CEFR, from which another self-assessment scale has been developed.

Linked to the CEFR levels, a European project, DIALANG, was created as a diagnostic assessment of reading, writing, speaking, and listening skills across 14 European languages (Alderson & Huhta, 2005). The items were developed with different language groups all working from the same set of test specifications. The test is ambitious in that test takers are able to choose not only the target language to be tested, but the language of the instructions, as well. Although the test content is linked to the CEFR proficiency levels, the test itself is not intended to certify proficiency, but rather to provide diagnostic information to the learner.

Despite the use of frameworks to assume equivalence, a complicating factor arises due to the differences in the time required to reach a given framework level in different languages. What is intended to have the same meaning, a particular proficiency level, in fact is arrived at in differing amounts of time depending on the language, even when instructional methods are the same. Years of experience in training soldiers in different languages has led the US military to devise a classification scheme for the relative difficulty in attaining particular proficiency levels for native speakers of English learning the languages for the first time. According to this scheme, a monolingual native speaker of English will generally take longer to develop a high level of proficiency in Arabic or Chinese than to develop a comparable level of proficiency in Spanish. This becomes important when

comparing proficiency scores across languages to investigate teacher efficacy, curriculum design, and merit pay for employees, or to set graduation requirements.

Proficiency-oriented tests based on descriptive frameworks and scales are not without their detractors. There have been criticisms of the oral interview process and the descriptions of text levels that comprise the reading proficiency descriptors for the FSI/ILR and ACTFL scales (Lee & Musumeci, 1988). Questions have been raised as to the usefulness of the CEFR for developing comparable tests (Weir, 2005), and though a detailed manual documenting procedures for establishing the validity of local exams intended to link to the CEFR has been developed (Council of Europe, 2009), many tests claim linkage without necessarily providing evidence to support the claim. There is also increasing awareness of the political nature of setting national or international foreign-language standards (Fulcher, 2004).

Not all testing programs with multiple language tests are proficiency based. The Advanced Placement (AP) language tests in the United States, for example, are aligned with performance in college-level language classes, rather than an external global proficiency scale (Bischof et al., 2004). Prototypes have also been developed for cross-cultural assessment of pragmatics (Hudson, Detmer, & Brown, 1995) and second-language task performance (Norris, Brown, Hudson, & Yoshioka, 1998). These projects are useful for informing assessment across languages even though they are not conceptually linked to the proficiency frameworks described above.

There are additional issues that need be considered for tests in multiple languages. For Internet or computer-based tests, the proper display of the target language text may be affected by the particular fonts loaded on the test machine; although, this is becoming less of an issue with increasing acceptance of standards, such as Unicode. A simple text input box, for example, must be set for right-to-left text for languages such as Arabic and Persian, but left-to-right for languages such as French and German. If test takers are not familiar with keyboarding in the target language, or if the keyboard used during test taking is different from what they are accustomed to, the assessment of writing via computer can introduce construct irrelevant variance into the test scores. Such variance would differentially affect test scores across languages.

Regional and dialectal variations in the language, as well as cultural variation in the communities in which the language is spoken, must also be considered when developing tests. In the past, "authenticity" was seen as an ideal in language instruction, with many language educators insisting that materials use in testing be written by native speakers of the language with the intent of being read by other native speakers of the language. In fact, both the ACTFL and FSI/ILR reading and listening proficiency descriptors are explicit in this requirement. However, this notion is called into question when assessing English (or another language) as a lingua franca in situations where neither participant is a native speaker of the language. Additionally, not every piece of "authentic" language is equally appropriate for use in a testing situation. An Indian radio interview with a speaker of Hindi may include some code-switching between Hindi and English, for example. With the increased globalization of the media, a magazine article in an Arab magazine may actually be a translation of a piece originally written in a different language. The suitability of materials like this, given the test purpose, must be taken into account when determining test content. Many of the recommendations made in the literature for adapting non-language content tests into other language formats is relevant to testing across languages, as well.

For foreign-language tests, an additional decision concerns whether to use the target language exclusively for the entire test, including instructions and test questions, or to use a different language, such as English, for the instructions and questions. If the target foreign language is used exclusively for both the reading passages and the test questions,

it can be challenging to determine whether an incorrect answer points to a difficulty in understanding the passage, a difficulty in understanding the question, or both. On the other hand, if the test uses a non-target language, such as English, for the instructions and questions, test takers who are not fluent in that language will be at a disadvantage.

Conclusion

There is little doubt that the need for assessment across languages will continue into the future to meet the needs of linguistically diverse populations and changing demographics. This is already being reflected in the demand for foreign-language instruction and assessment in an ever increasing variety of languages. Although need-driven demand has pushed the development of procedures and frameworks for working across language, much work remains to be done to better understand the extent to which different language forms of tests actually result in comparable sets of test scores. This technical challenge exists alongside the need to recognize the inherently human, and thus political, nature of testing to ensure that assessments across languages appropriately balance the technical requirements of quality assessment development with the ethical responsibility of defensible assessment use.

Assessment and Evaluation: Mixed Methods

CAROLYN E. TURNER

This entry describes a study which falls into the category of instrument development for assessment and evaluation purposes using a mixed methods research (MMR) design. Such an approach has often been discussed as the “procedure of choice” for assessment/test instrument construction in research contexts (Creswell, 2009). The discipline of language assessment and testing is no exception. Until the emergence of the third paradigm of MMR (Johnson & Onwuegbuzie, 2004), however, studies describing activity that employed both quantitative and qualitative data were not labeled as MMR, and were therefore difficult to identify through database searches. Presently, as the “third research community” gains ground (Teddle & Tashakkori, 2009; Creswell & Plano Clark, 2011), we now see an increasing number of researchers situating their studies in MMR claiming pragmatic approaches to research design.

Background of the Study

The study described below is situated within the area of health communication. It was carried out by the author and two colleagues, Michel Laurier and Talia Isaacs, who also contributed to this entry. With the increasing number of diverse linguistic populations living side by side, daily situations often involve interlocutors conversing in their second (or third) language (L2). One situation that is particularly challenging is a conversation between a health professional and a patient (Bender, Clawson, Harlan, & Lopez, 2004). This study arose from within the healthcare community and the desire of health practitioners to linguistically accommodate their patients (see Turner, Isaacs & Laurier, 2010; Isaacs, Laurier, Turner, & Segalowitz, 2011). Language barriers can arise when health practitioners and patients do not speak the same first language (Jacobs, Chen, Karliner, Agger-Gupta, & Mutha, 2006). Direct communication with patients has become a growing interest among health practitioners as opposed to the reliance on third parties (e.g., interpreters, family members, or both) especially in countries where there are two official languages (e.g., Canada, Belgium). This has implications for the development of pedagogical approaches to aid healthcare practitioners improve their L2 language abilities.

This entry reports on the first part of a L2 assessment instrument development project where construct definition was the focus. The purpose was to identify a list of speech tasks and ability levels that are specific and relevant to the nursing profession. In the long term, and not reported here, the results of this study will be used to inform the development of a L2 oral interaction assessment tool for teaching and learning purposes. Motivation came from registered nurses who were interested in a nursing-specific pedagogical tool to help enhance their workplace oral communication (i.e., L2 interactions with patients). This is not to be confused with a certification or licensing test.

2 ASSESSMENT AND EVALUATION: MIXED METHODS

The specific research questions were:

- Q1: To what extent do nurses identify, in a consistent and reliable way, specific speech tasks that they perceive as relevant and requiring an appropriate level of language ability in L2 interactions with patients?
- Q2: To what extent can the speech tasks so identified be scaled in relation to existing L2 performance benchmarks?
- Q3: To what extent do the patterns of speech tasks identified by nurses fall into well defined categories that could serve as the basis for developing a pedagogically oriented assessment instrument for nurse L2 training?

In order to obtain the needed data for the study described here, and in order to help make meaningful inferences, a MMR design was judged the most appropriate. A sequential exploratory mixed methods design (Creswell & Plano Clark, 2007) was employed. It included two sequential phases: a first phase of qualitative data collection and analysis and a second phase of quantitative data collection and analysis that built on the results of the first phase and in addition were informed by the results. There are numerous MMR designs, but when studying a phenomenon (in this case language needed for nurse-patient oral interaction) with the intent of developing an instrument it is recommended to initially collect qualitative data at the source (target population) and expand on the findings through quantitative means with a larger sample of the pertinent population. This study set out to identify the oral communication needs of nurses in the workplace (i.e., nurse-specific speech tasks). It was situated in the province of Quebec (Canada) and in-service registered nurses were the participants. Due to the bilingual nature of the setting (French and English), nurses frequently find themselves dealing with patients whose L1 is not the same as their own.

Several diverse procedures were used across the two sequential phases of this study, including direct input from nurses, that is, indigenous assessment (see Jacoby & McNamara, 1999; Douglas, 2000). The tools/procedures used in the first qualitative phase were: literature review, preliminary questionnaire/working document, focus group, and verbal protocol. The product was a questionnaire for nurses. The second quantitative phase included: descriptive statistics, Rasch analysis, exploratory and confirmatory factor analyses, alignment of resulting speech tasks with the Canadian Language Benchmarks (CLB) scale bands (a previously validated rating instrument commonly used for workplace purposes). The product of the second phase was a list of speech tasks and ability levels that are specific and relevant to the nursing profession. A visual diagram of the research design is seen in Figure 1.

Qualitative Phase

The first step in the qualitative phase was a comprehensive literature review of studies focusing on nurse-patient oral interaction. The literature consulted was: health, communication, language pedagogy, and measurement and evaluation. This content analysis resulted in 22 speech tasks (i.e., the language used in varying interactions between nurses and patients).

The next and second step of the qualitative phase was to devise a preliminary questionnaire with scales for *relevance* and *difficulty* to use as a working document with a small focus group of nurses (see Creswell & Plano Clark, 2007). The group consisted of five first language (L1) French registered nurses ranging from 20 to 35 years of experience ($M = 27.8$) at a Quebec regional hospital. They represented varying nursing domains. A

Figure 1 Sequential exploratory mixed methods design: instrument development

two-hour focus group session led by two of the researchers resulted in a final list of 19 speech tasks. Some of the original ones were deleted due to irrelevancy, and new relevant ones were added. In addition, specific contextual examples were provided.

The third step was to refine the list and reflect on the proficiency levels needed to perform the speech tasks when compared to a national standard of 12 band descriptors for L2 proficiency for professional purposes, namely the *CLB* (www.language.ca/display_page.asp?page_id=1). This was done through the use of verbal protocol (as an alternative to piloting for validation purposes) with a domain expert who was an experienced nurse with French as a first language. The data were transcribed and a content analysis was done. This step resulted in two decisions: (a) the 19 speech tasks from the focus group were retained, and (b) only the middle seven band descriptors out of the 12 on the *CLB* were deemed relevant to the nursing context (i.e., levels 4 through 10); thus the beginning (levels 1–3) and advanced proficiency levels (levels 11–12) were eliminated. The English version list of the 19 speech tasks retained was:

1. Check identity over phone.
2. Give directions over phone.
3. Reformulate pain description.
4. Give instructions in person.
5. Give instructions on phone.
6. Give info about services.
7. Summarize health situation.
8. Describe reaction to diagnosis.
9. Describe interventions.
10. Reason with patient.
11. Reassure patient.
12. Show empathy.
13. Clarify doctor's message.

4 ASSESSMENT AND EVALUATION: MIXED METHODS

14. Ask routine questions.
15. Refuse unreasonable requests.
16. Apologize to patient.
17. Encourage patient.
18. Manage patient's anger.
19. Inform patient of bad news.

The fourth and final step of the qualitative phase was to develop a questionnaire for the larger population of nurses to examine their perceptions and validate the relevancy of and proficiency levels needed to perform these 19 speech tasks. Two versions (French/English) within two formats (hard copy and online) were developed. The latter employed the tool *Survey Monkey* (www.surveymonkey.com). The 19 speech tasks and the seven middle-level *CLB* descriptors were provided and participants were asked to identify the relevant *CLB* level for each speech task using the prompt, "The person who can perform the following task . . . should at least be at level."

Quantitative Phase

As indicated in Figure 1, the initial step in the quantitative stage was the administration of the questionnaire to 159 registered nurses with a mean experience of 19 years (ranging from 1 to 36 years). The second step was to refine these data and to determine the degree of agreement among the nurses (i.e., to demonstrate convergence). A methodology employed in earlier studies was used, a combination of descriptive statistics (SPSS 14.0) and Rasch analysis (FACETS 3.60) (e.g., Blais, Laurier, & Rousseau, 2009).

A many-facet Rasch model (polychotomous) was used to analyze the ordered categories (Andrich, 1999) obtained from the nurses' ratings, that is, the seven middle-level *CLB* descriptors. The two facets were speech tasks (item indicators) and nurses (rater respondents). The analysis went through three iterations to obtain a good model fit. This process basically helped "clean up" the data. The population was reduced from 159 to 133 nurses. Those removed were due to same ratings on all statements, or erratic ratings.

FACETS provides a graphical summary (the "Rasch ruler") of the calibration results of each facet and its elements (see Figure 2). They are positioned on a common logit scale which appears as the first column in Figure 2, and the zero point is considered the mean. The second column represents the speech tasks and their difficulty level as judged by the nurses, with the most difficult at the top and the least difficult at the bottom. The speech task "Inform patient of bad news" was judged as the most difficult task for nurses in an L2, whereas "Check identity over phone" was the easiest overall. The third column indicates the severity of the nurse respondents with the more severe at the top and the more lenient at the bottom. The fourth/scale column demonstrates where the most likely boundaries between levels are located. It can be seen that mainly only five of the seven middle-level *CLB* descriptors were used in the nurse judgments. Infit mean-square coefficients were the main source of information used. The analysis revealed that all indicators had infit indices below Wright and Linacre's (1994) suggested cutoff value of 1.4, with the expected value of 1. (For further information on Rasch analysis, see *Rasch Analysis Transactions* www.rasch.org/rmt/) This analysis along with consideration of the descriptive statistics led to all 19 speech tasks being retained and to the validation of their proficiency levels as calibrated with reference to the *CLB* (i.e., it demonstrated agreement across the nurses on what should and shouldn't be considered difficult to articulate when interacting with a patient). The procedure confirmed all item behavior to be statistically adequate for the next analysis.

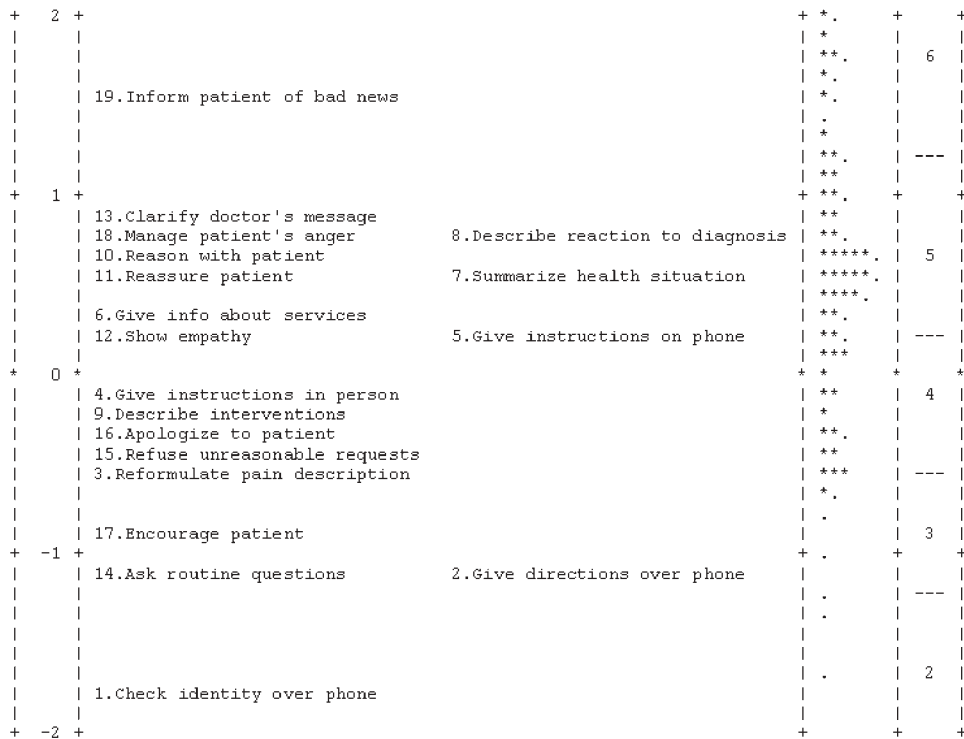

Figure 2 Location of the speech tasks (indicators) on the "Rasch ruler"

The objective of the next and third step in the quantitative phase (see Figure 1, exploratory and confirmatory factor analyses, EFA and CFA) was to identify the underlying constructs from the questionnaire data. These in turn would be used in the long-term goal of the project which was to develop a formative assessment tool to help nurses improve their L2 skills when dealing with minority language patients (i.e., a pedagogical tool, and not a high-stakes test for licensing purposes). In order to keep in line with the worldview of MMR and the sequential exploratory model used in this study, it was decided a priori that no speech tasks would be eliminated in the factor analyses. In the qualitative stage these speech tasks had been identified as the most relevant nurse–patient interactive tasks by the domain specialists (i.e., the nurses). Then subsequently in the second step of the quantitative phase, there was evidence that all 19 speech tasks were adequately functioning. These substantive data informed the factor analyses and overrode any statistical expedience of excluding speech tasks (i.e., for reasons of parsimony, better model fit, or both).

The factor analyses proceeded as follows. Using SAS 9.2, an EFA was first performed on the questionnaire data using varimax rotation. Figure 3 is a screenshot of the EFA commands used. When taking into consideration multiple indices (i.e., eigenvalues and screen plot, Kaiser's criterion, overall root mean-square residual), the analysis suggested three underlying factors. Following the worldview of MMR described above and the initial selection of three factors, a CFA was performed on the questionnaire data (for a detailed explanation see Isaacs et al., 2011). Several models were compared and Figure 4 shows the model selected, which was a second order CFA model and included all 19 speech tasks as exogenous variables (for the reasons stated above). Figure 4 only shows the statistically significant factor loadings. The first and higher order factor (labeled health-specific verbal

Figure 3 Screenshot of SAS commands for EFA (SAS Proprietary Software 9.2)

interaction with patients) predicted the three second-order factors (F1, F2, and F3), all of which, in turn, predicted the 19 speech tasks. Figure 4 shows the loadings of each item (speech task) on F1, F2, and F3. The latter were labeled respectively: F1—*emotional aspects of caregiving*, F2—*factual aspects related to the patient's medical condition*, and F3—*routine aspects*. It is to be noted that F3 was not significantly associated with F4 (−0.23). Results show that F1 and F2 were identified as being the most demanding in terms of L2 ability, and the most strongly associated with L2 ability required for nurse–patient interactions.

To evaluate the validity of the model, goodness-of-fit statistics were examined (Schermelleh-Engel, Moosbrugger, & Müller, 2003). The fit was not ideal from a statistical viewpoint, but informed by the qualitative phase (i.e., domain specialists, the nurses) which was confirmed by the second step in the quantitative phase, this model was deemed sufficient and the most appropriate for the purpose of a formative assessment tool for pedagogical use. Table 1 presents the goodness-of-fit statistics. It is important to note, however, that for a high-stakes test, other models would need to be considered.

The fourth and final step in the quantitative phase (see Figure 1) was to align the results with the *CLB*. In the third step of the qualitative stage, it was decided that the *CLB* scale would be reduced to the middle seven band descriptors out of the 12 on the *CLB* for the purposes of this study. This was carried into the questionnaire development. Interestingly

Table 1 Fit indices for the confirmatory factor analysis model that was selected

Fit statistics	Acceptable fit	Model fit
p value (χ^2 test)	$0.01 \leq p \leq 0.05$	<0.0001
RMSEA	$0.05 \leq \text{RMSEA} \leq 0.08$	0.11
NNFI	$0.95 \leq \text{NNFI} \leq 0.97$	0.85
CFI	$0.95 \leq \text{CFI} \leq 0.97$	0.89

Figure 4 Second order confirmatory factor analysis model

Notes. While the arrows show all of the relationships specified in the structural equations for the confirmatory factor analysis model, only statistically significant factor loadings are shown in the factor loading boxes ($\alpha = 0.01$, two-tailed). The number appearing in the second line of these boxes after the “#” sign refers to the speech act item number that the factor is linked with. Boxes that contain “D”s are the error terms associated with the second order factors. Boxes that contain “E”s are the error terms associated with the speech acts. Notably, there is no correlation between the second order factors (i.e., they are orthogonal). Adopted from Isaacs et al. (2011).

Figure 5 Aligning speech tasks with CLB scale bands

enough, the quantitative analyses showed that the speech tasks were only calibrated onto five CLB scale bands, not seven, resulting in a five-point scale (see Figure 5). This had implications for further decision making in terms of the constructs and content to be included in the development of the formative assessment tool.

Issues and Challenges or Implications

This entry has demonstrated the use of mixed methods research for assessment and evaluation purposes, and more specifically for helping define the constructs to be included in the specifications of an instrument development project. It has shown that in a mixed methods sequential exploratory design, the researchers take into consideration the results from both qualitative and quantitative phases (i.e., they are perceptive to how they inform each other). In the study described here, decisions made at the first phase (qualitative) influenced the direction of the second phase (quantitative). In addition, the first phase results helped guide the second phase in instances of quantitative analysis limitations. The purpose and research questions drove the inquiry. This is not to say that MMR does not bring challenges (Greene, 2007; Creswell & Plano Clark, 2007, 2011; Creswell, 2009; Teddlie & Tashakkori, 2009), but, for certain types of research, the combined use provides an important profile of the research problem at hand. In this study, for example, it provided an expanded empirical basis for determining which speech tasks are the most difficult and relevant in a particular context. This not only provided evidence, it also contributed credibility to the task from the viewpoint of the stakeholders involved (i.e., nurses and patients).

Assessment and Evaluation: Quantitative Methods

JAMES DEAN BROWN

The Evaluation Study

In evaluating the English Language Institute (ELI) at the University of Hawai'i at Mānoa (UHM) in the early 1990s, we carefully developed criterion-referenced tests (CRTs) directly related to the objectives of each of our eight courses (for descriptions of all aspects of our curriculum development processes, see Brown, 1995; for much more on these CRTs, see Brown, 1993). The tests for each course were developed in two forms and administered at the beginning of the courses as diagnostic tests (with half the students taking Form 1 and half taking Form 2) and at the end of the courses as achievement tests (with the students taking the other form). We were interested in evaluating the degree to which students had learned or acquired the knowledge and skills represented in the course objectives by comparing their scores at the beginning and end.

We knew from experience that norm-referenced tests (NRT) like the Test of English as a Foreign Language (TOEFL), Test of English for International Communication (TOEIC), the International English Language Testing System (IELTS), and so forth are very useful for proficiency testing (used primarily in admissions decisions and occasionally for comparing programs) and placement testing. However, we also knew that such NRTs should not be used for assessing the learning of the particular objectives within our program because NRTs are (a) not designed for such purposes, (b) not reliable for such purposes, and (c) not sufficiently sensitive to reflect the sorts of learning that go on in short, one-semester courses with only 45 contact hours (for evidence of such problems, see Childs, 1995). We therefore carefully designed in-house CRTs to measure the exact sorts of knowledge and skills the students were learning in each course (as represented by the course objectives). In short, we wanted student learning to show up on our tests, so we used objectives-based CRTs designed specifically to evaluate the effectiveness of our courses (for more on CRTs, see Brown & Hudson, 2002; Brown, 2005).

In making any such pretest–posttest comparisons, one question that inevitably arises is the degree to which any changes observed in the students' scores between the beginning and end of the course could have occurred by chance alone (i.e., are statistically significant). To study that issue, I used repeated-measures analysis of variance (ANOVA) procedures (as did Lynch, 1992, as part of his evaluation study in Mexico). I could also have used a paired *t*-test, but chose to use repeated-measures ANOVA because the statistical program I use provides additional statistics for effect size and power in the ANOVA results that are not available in paired *t*-test results.

Entering the Data

I use a number of different statistical programs in my daily work, so I find it convenient to always enter and store my data in a spreadsheet program. However, researchers who only use SPSS may choose to enter their data directly. In either case, entering data for the

2 ASSESSMENT AND EVALUATION: QUANTITATIVE METHODS

Figure 1 Complete example data set as entered in Excel™

study described here involved recording the students' ID numbers, the form that they took first (PreForm), their pretest scores, and their posttest scores.

Figure 1 shows a simple data set taken from our in-house evaluation of the multiple sections of our ELI 82 (Advanced ESL Reading) course. Notice that the data are entered into the Excel spreadsheet program in Figure 1. Note also that each student's data are put in a single row and that each of the four variables (ID, PreForm, Pretest, and Posttest) is recorded in a separate column.

Next, I saved the Excel spreadsheet data in a file and imported that file into my SPSS program (version 16 in this case). Readers who wish to follow along with this analysis may want to use Excel first as I did or enter the data directly in their own version of SPSS. To enter the data directly, just open the Data Editor in SPSS and click on the *Variable View* tab in the bottom left corner of the screen. Type in the variable names in the first four cells of the first column (labeled *Name*). Then go back to the Data Editor (by clicking that tab in the bottom left corner of the screen) and enter the numbers that you see in Figure 1 into SPSS Data Editor—a part of which is shown in Figure 2.

Running a One-Way Repeated-Measures ANOVA

This ANOVA is necessarily a repeated-measures design because the same people took both the pretest and the posttest. If different people had been involved in the pretest and posttest, an ordinary ANOVA could have been run. But most pretest–posttest analyses like this one will involve the same people. Indeed, in most cases, the researcher will want to check to make sure that all the same people are represented in both tests by eliminating anyone who was absent on one of the testing days. In any case, pretest and posttest scores must be present for every student for the one-way repeated-measures ANOVA to be correctly performed in SPSS.

	ID	PreForm	Pretest	Posttest
1	1	1	71.43	82.14
2	2	1	92.86	92.86
3	3	1	64.29	75.00
4	4	1	50.00	92.86
5	5	1	57.14	78.57
6	6	1	75.00	92.86

Figure 2 Partial view of the example data as they appear in SPSS™ Data Editor

The assumptions for repeated-measures ANOVA are multivariate normality, homogeneity of covariance matrices, and sphericity. This type of analysis is robust to violations of the first two assumptions, and the third assumption can be checked by examining Mauchly's test of sphericity, which is presented automatically in the SPSS output for such designs. After checking these assumptions, enter the data into the SPSS program and do the following (please pay special attention to which table or figure the instructions are discussing; some of them look very similar to each other):

1. Select *Analyze* from the middle of the menu bar near the top of the screen.
2. In the menu that drops down, select *General Linear Model*.
3. From the menu that pops out, select *Repeated Measures . . .* A window should appear that looks like the one in Figure 3a.
4. In the box below *Within-Subject Factor Name* where it says "factor1," type "PrePost" as shown in Figure 3a. Then type "2" in the box next to *Number of Levels*, also as shown in Figure 3a (because there are two occasions Pretest and Posttest).
5. Click on the button that says *Add*. The *Repeated Measures Define Factor(s)* menu should now look like Figure 3b with "PrePost(2)" in the box just below and to the right of *Number of Levels*.

4 ASSESSMENT AND EVALUATION: QUANTITATIVE METHODS

Figure 3a Setting up the factor name and levels in repeated measures in SPSS™

Figure 3b Defining the factor and levels in repeated measures in SPSS™

Figure 3c Moving pretest and posttest into the levels in repeated measures in SPSS™

Figure 3d Pretest and posttest moved into the levels in repeated measures in SPSS™

Figure 4 Repeated-measures options in SPSS™

6. Next, click the button that says *Define*. The result should look like Figure 3c with “_?(1)” and “_?(2)” in the top box on the right.
7. Now move “Pretest” and “Posttest” from the box on the left in Figure 3c to the top box on the right by clicking on each and using the right arrow button between the boxes to move them. The result should look like Figure 3d with “Pretest(1)” and “Posttest(2)” in the top box on the right.

Now that the variables are arranged, do the following to actually conduct the repeated-measures ANOVA:

1. Click on the *Options* button (like the one shown in Figure 3d). A *Repeated Measures: Options* window should appear as shown in Figure 4.
2. Move “(Overall)” and “PrePost” from the *Factor(s) and Factor Interactions* box on the left to the *Display Means for* box on the right by clicking on each and using the right arrow button to move them. The result should look like Figure 4.
3. Now make a check mark next to *Descriptive statistics*, *Estimates of effect size*, and *Observed power* by clicking on the boxes next to each as shown in Figure 4.
4. Click on the *Continue* button to go back to the *Repeated Measures* window.
5. Now the analysis will actually happen when you click the *OK* button.

Be patient, the program may take a few moments to run. Remember it is doing mathematics that would take you days to do by hand.

Reporting the One-Way Repeated-Measures ANOVA

Once the program finishes calculating everything, you should see your output on the right side of the screen. Go ahead and have a look. Unless you are long familiar with such output, you will probably find it a bit overwhelming and confusing. The easiest strategy is probably to focus on a few important tables. Figure 5 shows the descriptive statistics for the Pretest and Posttest results as they appear in SPSS output. Figure 6 shows the ANOVA results. Go ahead and find those tables in the output.

Unfortunately, the output tables in Figures 5 and 6 are not formatted as they typically are in published papers. To amend them for inclusion in a paper or report, I usually copy the SPSS output to Excel. With both SPSS and Excel running, click on the Descriptive Statistics table in the SPSS output and then select the *Edit* menu and *Copy*. Next move into the Excel spreadsheet and select the *Edit* menu and *Paste*. The table should appear as shown in the first four rows of Figure 7. Repeat the same process for the Tests of Within-Subjects Contrasts table.

Figure 7 ANOVA output after being copied from SPSS[™] to Excel[™]

The information in Figure 7 is still not ready to report. It is first necessary to delete some things, alter a few labels to fit the requirements of the APA publication manual (American Psychological Association, 2010), and in most cases, modify the number of decimals to two places (again to suit the APA manual), as shown in Figure 8 (see the Excel manual or help screens for more about how to do these things).

Interpreting the One-Way Repeated-Measures ANOVA

After blocking and copying each of the two tables in Figure 8 from Excel (using the *Edit* menu and *Copy*) into Word (using the *Edit* menu and *Paste*) and a bit of formatting, Tables 1 and 2 are ready to include in a paper or report. Table 1 shows the means and standard deviations for the Pretest and Posttest results. From right to left, notice that the standard deviations for the Pretest and Posttest are 13.69 and 11.77, respectively, which indicates that the scores were somewhat more widely dispersed in the Pretest results than in the Posttest, though the difference is not very big. Notice also that the means for the Pretest (65.71%) and Posttest (81.07%) are quite different. Indeed, they are 15.36 percentage points apart. However, such large differences can occur by chance alone, which is why we are conducting the ANOVA procedure.

Table 2 shows the repeated-measures ANOVA results. Let's ignore a great deal of the information in Table 2 and zero in on the crucial information. In the first row of numbers labeled PrePost (in the column labeled *p*), it turns out that $p = .00$ so the difference between the pretest and posttest is significant at below the $p < .05$ level. This means there is less than a 5% probability that the observed difference between the pretest and posttest means is due to chance alone. Note in the next column that the Eta squared (*Eta*²) value is .55. This statistic indicates that 55% of the variance in this ANOVA design is accounted for by the PrePost differences (and that the remaining 45% is error, which is to say that variance not accounted for). Thus the pretest–posttest differences are fairly important (55%) relative to other sources of variance (45%) in this study. The power statistic in the last column is 1.00, which is as high as that statistic can go, and means that factors in the research design like *n*-size, measurement reliability, effect magnitude, and so forth were all adequate to detect any differences if they were present. If a significant difference had *not* been found in the ANOVA, the power statistic would have been particularly helpful in understanding whether the *lack* of a significant difference was due to chance fluctuations. That is why I always check the box next to *Observed power* when I do such analyses.

Conclusions

The gain reported here of 15.36% may seem small given that each course involved 45 hours of instruction. However, these data were for the first round of test/curriculum development. Careful CRT item analysis later led to improvements in the tests, objectives, teaching, and learning that in turn resulted in a more clearly defined curriculum in which the tests showed greater gain.

In addition, those familiar with quantitative research may wonder why there was no control group (i.e., a group that received no treatment or had a placebo instead of a treatment) in this evaluation study. Lynch (1992) did have such a control group in the quantitative part of his evaluation study in Mexico. However, as he pointed out in Lynch (1986), having a treatment and control group design simply shows that the treatment (*instruction* in this case) is better than *nothing*. Indeed, control groups are not always necessary or

appropriate (see for instance, US Government Accountability Office, 2009). Nonetheless, in studies of this sort, the practice effect of taking the same test twice may be an important concern. In such cases, a control group may help to dispel that concern or at least to understand the degree to which the practice effect is an issue.

In the ELI evaluation studies, we argued that the practice effect was part of the ELI experience. That is, if the students' scores changed between the pretest and posttest, we took the view that it was due to what happened to them in the ELI, including the course diagnostic test (i.e., the pretest), instruction in the particular course being tested, instruction in their other ELI courses, and the effects of living and studying in Hawaii. In other words, we could not take credit for all of the learning we were able to demonstrate, but we were happy to find that the whole package was having an effect on the academic English of our students.

Assessment and Testing: Overview

CAROL A. CHAPELLE AND LIA PLAKANS

What language testing does is to compel attention to meaning of ideas in linguistics and applied linguistics. Until they are put into operation, described, and explained, ideas remain ambiguous and fugitive. A test forces choice, removes ambiguity, and reveals what has been elusive: thus a test is the most explicit form of description, on the basis of which the tester comes clean about his/her ideas. (Davies, 1990, p. 2)

These words express what many applied linguists recognize: that language assessment and testing intersects almost all language-related issues that applied linguists study. These intersections take place at the level of ideas, but typically also in many of the everyday practices in language teaching, certification, and gate keeping, where language tests are used. In an intensive French program, students are tested for their level of French-language ability for placement into an appropriate level of a class. Applicants hoping to be admitted to a university or hired for a job requiring spoken English have to attain a particular score on designated language tests. In some cases, would-be immigrants have to attain a particular score to have their application for immigration to a particular country accepted. In research on second language acquisition, scores on language tests are often used as evidence for learners' development. In the classroom, assessment results provide information to teachers and to students about their learning. In educational testing, language ability is assessed for both native speakers and non-native speakers, but the researchers and practitioners that align themselves with applied linguistics typically work with second language assessment, and therefore so do the entries in the encyclopedia.

Across the many different testing contexts, both the terms "test" and "assessment" are used to denote the systematic gathering of language-related behavior in order to make inferences about language ability and capacity for language use on other occasions. This core meaning of the two terms links them even though each is more strongly associated with certain collocates and contexts of use. The expression "high-stakes testing" is more frequent than "high-stakes assessment" (with a ratio of approximately 3 : 2 based on a Google search of the Web), and the expression "classroom assessment" is more frequent than "classroom testing" (with a ratio of approximately 3 : 1). Throughout the encyclopedia both of these terms are used, sometimes interchangeably, but typically with their preferred collocates. The title of this section contains both terms because of the different meanings that they hold for some people. Although "language testing" is the preferred expression on the Web (with over a million instances), language assessment (with not even a half a million instances) denotes for many people a more varied process of data gathering and interpretation than language testing.

Assessment Uses

The selection of the term—assessment or testing—is often governed by the use of the test, and accordingly assessment uses are described in several entries in the encyclopedia. One entry explains the basic approaches that help users to understand the requirements of different USES OF LANGUAGE ASSESSMENTS. Another entry, HIGH-STAKES LANGUAGE TESTING,

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0603

2 ASSESSMENT AND TESTING: OVERVIEW

considers test uses with serious consequences, in education or elsewhere. Test uses in the educational context are described in three entries: **ASSESSMENT IN THE CLASSROOM**, **LANGUAGE ASSESSMENT IN PROGRAM EVALUATION**, and **LANGUAGE TESTING AND ACCOUNTABILITY**. Two entries describe test uses connected to government, **LANGUAGE TESTING AND IMMIGRATION**, and **LANGUAGE TESTING IN THE GOVERNMENT AND MILITARY**. One entry describes **LANGUAGE TESTING IN SECOND LANGUAGE RESEARCH**. The language testing needs across these domains differ, and therefore the specific approaches to and aspects of language tested differ as well.

What Is Tested?

As the breadth of this encyclopedia attests, language is a complex phenomenon that can be conceptualized in many different ways. This complexity is apparent in the many aspects of language that are assessed. Four of the entries describe issues and practices in assessing systems of knowledge: **ASSESSMENT OF GRAMMAR**, **ASSESSMENT OF VOCABULARY**, **ASSESSMENT OF PRAGMATICS**, and **ASSESSMENT OF CULTURAL KNOWLEDGE**. Entries cover assessment of each one of “the four skills,” as they have been traditionally called: **ASSESSMENT OF LISTENING**, **ASSESSMENT OF READING**, **ASSESSMENT OF SPEAKING**, and **ASSESSMENT OF WRITING**. Recognition of limitations with such a four-skill view of language, however, has prompted test developers to construct tests of combined skills, such as a test that would require the examinee to read a text and then speak about it. Such **ASSESSMENT OF INTEGRATED SKILLS** has proven to be an important avenue of research and development, particularly in tests of academic language ability whose scores are intended to reflect how well examinees’ language will allow them to perform on academic tasks, which typically involve a combination of skills. Regardless of the particular aspect of language tested, the conception of language that underlies a particular test is expressed in a model of language, and the ideas behind construction of models in language assessment are described in **MODELING LANGUAGE FOR ASSESSMENT**.

Assessment Methods

Language assessment methods have been developed to prompt examinees in a manner that will elicit relevant performance. The entry on **LANGUAGE ASSESSMENT METHODS** describes the work that has gone into devising appropriate methods to capture the detail of the linguistic knowledge that underlies examinees’ performance as well as the performance itself. Whether the examinees’ performance is intended to be used as a sign of their language knowledge or as a sample of their potential performances on a similar range of tasks, the methods used to gather the performance are critical in determining what the resulting test score can mean. As a consequence, schemes have been developed to describe the particular facets of language test methods, most notably by Bachman (1990). In addition, new combinations of test method facets have resulted in considerable interest and research into such testing methods as **PAIRED AND GROUP ORAL ASSESSMENT**, **SELF-ASSESSMENT**, and **TASK-BASED ASSESSMENT**. The encyclopedia therefore contains an entry on each of these topics.

One facet of the test methods—evaluation of examinees’ language—is an area of central importance. Some aspects of language knowledge can be evaluated through the use of selected-response items (such as multiple choice); however, most language-test uses require a sample of language performance that the examinee produces, whether it be a word, a sentence, a turn in an interactive dialogue, a written essay, or one of many other possibilities. Whereas responses on a selected-response test can be scored as correct or incorrect, rating of linguistic performance is based on a more complex set of considerations. As a

result, research into RATING SCALES FOR LANGUAGE TESTS is an ongoing area of activity in language assessment. Rating of written language is a challenge that is common to both native language and second language assessment, but in second language assessment, tests of oral language ability are also widely used, and therefore RATING ORAL LANGUAGE is an area of particular attention in applied linguistics. With advances of knowledge and practice in computational linguistics, a promising area of inquiry is the study of AUTOMATED ESSAY EVALUATION AND SCORING and COMPUTER SCORING OF SPOKEN RESPONSES.

Developing Assessments

Many applied linguists work in areas where their expertise is in language test development. In this context, knowledge of language, models of language ability, and testing methods are needed in addition to process knowledge about how to design tests using TEST SPECIFICATIONS. Test design often takes place in a context where a test already exists, and therefore one entry examines together the related processes of TEST DESIGN AND RETROFIT. It is commonplace today for language tests to be computer delivered even if the language performance is not automatically scored by computer. Therefore, an important part of test development is an understanding of AUTHORING TOOLS FOR LANGUAGE ASSESSMENT. A final process in moving a new test from development to use is setting CUT SCORES ON LANGUAGE TESTS. This process makes the test results usable because it allows test users to assign meaning to them, typically in terms of what interpretations and actions one should be able to make on the basis of a specific test score. All of these test development processes are critical for developing high-quality tests, but a complementary set of processes are also needed for evaluating assessments.

Evaluation of Language Assessments

Evaluation takes place through validation research which is conducted to support the interpretations and uses of test scores. VALIDATION OF LANGUAGE ASSESSMENTS is described in one entry as the organizing framework for all of the research that supports test score use. This research consists of a vast array of types, not all of which are covered in the encyclopedia. The encyclopedia aims to provide a conceptual overview of the approaches to research to demonstrate how they fit into the process of validation. STATISTICAL ANALYSIS OF TEST RESULTS outlines the fundamental item-level statistics that are typically done to examine the empirical performance of the test and the individual items for each examinee group. RELIABILITY AND GENERALIZABILITY OF LANGUAGE TESTS explains the importance of reliability, or consistency, as a characteristic of test scores and the reliability issues that researchers face in language assessment. Examining another approach to analysis of consistency, GENERALIZABILITY THEORY IN LANGUAGE TESTING, explains an analytic method for estimating consistency that yields an estimate of the amount of error contributing to scores by sources such as raters and tasks.

Two entries provide a basis for understanding some of the other quantitative methods used in validation research: CORRELATIONAL RESEARCH IN LANGUAGE ASSESSMENT and STRUCTURAL EQUATION MODELING IN LANGUAGE ASSESSMENT. Two entries introduce qualitative methods used in validation research: DISCOURSE ANALYSIS IN LANGUAGE ASSESSMENT and QUALITATIVE RESEARCH IN LANGUAGE ASSESSMENT. Finally, two entries explain types of inquiry that require critical and empirical examination of the ideological and consequential basis for test use in a particular context: VALUES IN LANGUAGE ASSESSMENT and WASHBACK IN LANGUAGE ASSESSMENT.

Issues in Language Assessment

The extensive use of assessment in all areas of research and education raises a number of issues that are constant sources of concern for language testing researchers. One such issue is explained in an entry on *ENGLISH-LANGUAGE LEARNERS AND SUBJECT AREA TESTS*, which describes the difficulty in interpreting scores on school achievement tests of math or science, for example, as indicators of English-language learners' knowledge of those content areas. This issue arises in the context of school-age learners, as does the issue of *ASSESSMENT OF YOUNG ENGLISH-LANGUAGE LEARNERS* for obtaining scores that reflect their language ability.

The fact that performance on content tests assumes proficiency in English creates a potential for test bias. Another entry describes test *BIAS IN LANGUAGE ASSESSMENT*, which can also arise in language tests when one group of test takers systematically performs differently than another for reasons unrelated to the ability that the test is measuring. Bias is one of the issues pertaining to *FAIRNESS IN LANGUAGE ASSESSMENT*, which is discussed more fully in another entry.

Another issue of growing importance related to fairness is *STANDARD SETTING ON LANGUAGE TESTS*, which entails the concepts and procedures used to make the link between a test score and a particular score meaning. In an environment where educational bodies are generating proficiency level descriptors and test developers are required to demonstrate that test scores can be interpreted on those scales, standard-setting activities are in the spotlight. Research in this area is particularly interesting when researchers investigate *ASSESSMENT ACROSS LANGUAGES*.

In a context where language assessments are so pervasive and consequential for test takers, the title of Shohamy's (2001) book, *The Power of Tests*, sets the stage for the final two issues. One is *LANGUAGE ASSESSMENT LITERACY*, the knowledge that applied linguists need to have in order to construct, analyze, and interpret language tests. The second is *ETHICS IN LANGUAGE ASSESSMENT*, the responsibility to use that knowledge with an awareness of who may benefit and who may be harmed from it.

Research and practice in language testing is constituted from the work of a large and diverse community, whose members span a range of professions from academia to government, to business. The following distinguished scholars were chosen to feature in biographical entries from a much larger set of distinguished members of the profession: Charles J. ALDERSON, Lyle F. BACHMAN, John B. CARROLL, John L. D. CLARK, Alan DAVIES, Robert LADO, John W. OLLER, Jr.; and Charles STANSFIELD. Their biographies reveal a diverse set of backgrounds and different paths that brought them to language assessment, but what they share is a pragmatic motivation driving their scholarship and practice—a motivation to improve professional practices in language assessment.

Assessment in the Classroom

ANNE KATZ AND MARGO GOTTLIEB

The role of assessment in the language classroom occupies an increasingly visible place in the language education literature as teachers, researchers, and test specialists examine how assessment can be woven into instruction to support language development (Davison & Leung, 2009). In this entry, classroom assessment is distinguished from traditional language tests and measurements to encompass a broad conceptualization of what teachers and students do to gather and share information in the classroom. It involves a process of planning, collecting, analyzing, and using information over a period of time, via multiple types of measurement strategies. As a socially constructed activity, classroom assessment is embedded in a context that includes teachers, students, and community members as meaningful partners in the learning process.

This conceptualization is congruent with educational assessment literature that categorizes classroom assessment as an integral component of curriculum design along with teaching and learning (Shepard, 2000; Arkoudis & O'Loughlin, 2004; Cumming, 2009). Figure 1 illustrates how assessment is embedded within instruction and learning.

Within this educational context, theories of instruction and learning inform choices about classroom assessment practice. From a traditional psychometric perspective, testing is viewed as a discrete activity within teaching and learning (Moss, 2008). In language classrooms shaped by this perspective, teachers deliver instruction and, at the end of the lesson, use tests to measure what students have learned, often drawing on test materials provided in commercial course packs or provided by departments or external agencies. In the emerging assessment culture of the 21st century, however, the connection between learning and assessment is more tightly drawn as teachers are challenged to take on a more active role and pay increased attention to students' processes in developing language as well as the products of that learning as students engage in classroom tasks, interact with peers, respond to the teacher, and complete assignments. Shepard (2000) identifies several principles, aligned with reformed views of curriculum and constructivist theories of learning, which form a foundation for these new ways of conducting classroom assessment:

- Using challenging tasks that elicit higher-order thinking.
- Including learning processes as well as learning outcomes.

2 ASSESSMENT IN THE CLASSROOM

- Integrating assessment into instruction as an ongoing process.
- Using assessment information to support student learning.
- Engaging students actively in evaluating their work.
- Making expectations or success criteria visible to students.

Congruent with these principles, Moss (2008) draws on sociocultural theory to describe assessment in terms of a range of evidence that can address questions or problems in learning. With learning viewed as an interactive process among learners, activities/tasks, resources, and other people within a specific context, a more adaptive and dynamic notion of assessment is emerging along with an expanded role for teachers in designing and implementing these assessments. Moss identifies three types of assessment integrated within the complex social situation of the classroom: traditional or *documentary* assessments, *inherent* or incidental, nonverbal assessments (e.g., a puzzled look), and *discursive* assessments, when participants talk about an activity in an evaluative way (p. 226). A similar perspective on classroom assessment is appearing in discussions of second language learning as researchers examine the relationship between assessment, feedback, and learning (Davison & Leung, 2009).

Theories of language also play an important role in explaining how assessment is enacted in the language classroom. As Bachman (1990) notes, “advances in language testing do not take place in a vacuum; they are stimulated by advances in understanding of the processes of language acquisition and language teaching” (p. 3). Language teaching methodologies drawing on communicative and learner-centered approaches have focused on how learners communicate meaning, how they recognize and respond to social and cultural cues, and how they manage their own learning.

Types of Language Assessments

The advent of constructivist learning principles, sociocultural views of assessment, and task-based communicative approaches in language teaching has been accompanied by the use of multiple approaches to language assessment that extend the repertoire of tools teachers can choose to use to understand and support classroom learning. These tools go beyond traditional paper-and-pencil tests at the end of a unit to include a broad array of assessment types useful in the language classroom to meet the wide range of purposes and contexts for collecting information (O'Malley & Valdez Pierce, 1996; Brown & Hudson, 1998). The terms *alternative assessment*, *authentic assessment*, and *performance assessment* (here used synonymously to refer to alternatives to conventional testing) are associated with this expansion of types of assessments that move toward instructionally focused ones that “capture significant and enduring educational outcomes” (Herman, Aschbacher, & Winters, 1992). These alternatives to traditional assessment include observation checklists, anecdotal notes, journals, student work samples, and group projects, coupled with accompanying rubrics, which are integrated into and often indistinguishable from learning activities. Additional assessments include portfolios focused on the learning process and tasks embedded within instructional activities.

Figure 2 presents a framework (based on McTighe & Ferrara, 1998) that incorporates a continuum of assessment types and organizes them in light of what learners have to do in order to participate in the assessment. For example, do learners *select* an answer among some choices or do they *construct* a response? Note that when teachers use performance-based assessments—observing what learners do during classroom tasks and then scoring those performances—they incorporate assessment into the flow of classroom activities.

These multiple assessment types highlight the shift in emphasis from externally produced assessments to those created by teachers that more closely reflect the local context of the

Selected-Response Format	Constructed Response Format			
<i>Multiple choice</i> <i>True/false</i> <i>Matching</i> <i>Same/different</i> <i>Grammatical/ungrammatical</i>	Brief Constructed Response	Performance-Based Assessment		
	<i>Gap fill</i> <i>Short answer</i> <i>Cloze</i> <i>Label a visual</i> <i>Sentence completion</i>	Product-focused	Performance-focused	Process-focused
		<i>Essay</i> <i>Story/play/poem</i> <i>Portfolio</i> <i>Report</i> <i>Video/audiotape</i> <i>Poster session</i> <i>Project</i>	<i>Oral presentation</i> <i>Dramatic reading</i> <i>Role-play</i> <i>Debate</i> <i>Interview</i> <i>Online chats</i>	<i>Observation</i> <i>Checklist</i> <i>Rubric</i> <i>Anecdotal notes</i> <i>Reflection</i> <i>Journal</i> <i>Learning log</i>

classroom and the complex learning of language knowledge and skills taking place there (Moss, 2008). Assessments that focus on student performances in the classroom—either products or processes—require a task or activity to elicit the performance as well as scoring criteria or rubrics to gauge the quality of the performance and to record it.

A good deal of the classroom assessment literature for teachers describes various ways of collecting and judging student performances as part of planned assessment activities integrated into instruction (e.g., O'Malley & Valdez Pierce, 1996; Gottlieb, 2006; Coombe, Folse & Hubley, 2007). A sociocultural view of classroom assessment indicates that it also takes place throughout the instructional period as teachers engage with students, guide student-to-student communication, and monitor peer activities. These interactions in real time offer teachers, and learners, opportunities to give and receive immediate feedback relevant to specific language performances. Davison and Leung (2009) describe such a dynamic approach, incorporating both in-class formal and informal performance assessment in a “typology of possibilities” (p. 400) ranging from in-class formative assessments, such as observing learners’ language use and asking questions to check for understanding, to more formal assessments, such as portfolios, structured student self- and peer reflections, and the use of rubrics to interpret language performances.

In addition to changing *how* assessment data are collected, emerging practices in classroom assessment have sharpened the focus on *what* will be assessed by aligning assessment more closely to learning. When teachers align assessment to instructional objectives or targets, they emphasize the usefulness of assessment in informing decision making about teaching and learning. Thus, when assessment tasks—such as a short-answer quiz or a role play—are designed in light of specific learning targets, the information collected provides evidence of students’ progress toward meeting those learning targets. Classroom assessment practices aligned to instruction can serve two pedagogical purposes: *summative* and *formative*. The following section will explore these two uses for assessment information.

Assessment for Formative Purposes

Classroom assessments that focus on what students have accomplished as a result of a period of instruction have been characterized as *summative* uses of assessment or assessment of learning since they act as snapshots documenting accumulated student performances.

4 ASSESSMENT IN THE CLASSROOM

A complementary approach focuses on *formative* uses of assessment or assessment *for* learning (Assessment Reform Group, 2002). This approach suggests that assessment can be a means to promote learning, not only to describe or monitor it. From this perspective, then, teachers focus less on such functions of assessment as monitoring and accountability and more on assessment's role in supporting learning by empowering learners and attending to motivational factors. It is important to emphasize that the distinction between summative and formative assessment is not a function of type of assessment (e.g., a multiple-choice test versus a portfolio) but rather of purpose in using assessment tools (Davison & Leung, 2009).

Research suggests that assessment used for formative purposes, or assessment *for* learning, can improve student attainment (Black & Wiliam, 1998) if two conditions are met: the learner perceives a gap between the present and the desired state of knowledge, understanding, or skill and the learner takes action to close the gap and meet the targeted level. Assessment tasks that address these two conditions thus support learner achievement. Harlen and Winter (2004) describe characteristics of classroom assessment in line with these conditions:

- Information about both processes and products of learning is gathered.
- This information is used to adapt the teaching/learning environment and is shared with learners to help them learn and to improve their performances.
- Learners and teachers share a common understanding of the learning targets for instructional activities.
- Learners are active participants in learning and assessing their work through self- and peer assessments.

Several studies have examined how formative assessment is operationalized in language classrooms. In early work in this area, Rea-Dickins (2001) describes formative assessment as "action taken as a consequence of an assessment activity" (p. 432), actions, she notes, that can be taken by any stakeholders in the assessment process and be manifested in multiple ways. For example, she describes both teacher intervention strategies as well as self- and peer-monitoring strategies that contribute to language learning. Noting that formative assessment plays a key role in the language classroom when teachers are skillful in observing and interpreting the progress of student learning, Rea-Dickins cautions that further work is needed to determine what constitutes "quality" in implementing formative assessment, particularly in creating learning opportunities and recognizing evidence of language learning.

In a later study addressing this issue, Rea-Dickins (2006) extends her exploration of interaction in language classrooms as an essential component of formative assessment by examining teacher feedback and student responses. She points out that "feedback is only formative if it brings about a change of some kind for the learner" (p. 168). Her analyses of classroom interactions suggest that both formative and summative purposes for assessment can be interwoven within instruction to provide a balance of assessment types, but for learners to understand how to participate effectively in each type, teachers must make their intentions and expectations explicit.

Also focusing on how teachers implement formative approaches to assessment, Colby-Kelly and Turner (2007) examine the match between curriculum requirements related to assessment and classroom practice. While five types of formative assessment are identified in the curriculum: (a) self-assessments, (b) peer assessments, (c) teacher–student feedback, (d) teacher–group feedback, and (e) teacher–class feedback, teachers primarily utilize teacher–student feedback in the classroom. They also note that several teachers expressed

hesitancy about providing feedback to a student in front of classmates, fearing it might be embarrassing, a view some students may also hold. These studies focusing on classroom interaction highlight the interwoven roles of teachers and students in the learning process and suggest the complexity of implementing formative assessment so that it fulfills its promise of promoting language learning.

In learner-centered classrooms, both teachers and students are expected to assume active roles in designing and implementing assessment practices. Teachers assess and respond to student performances, manage assessment information that has been collected, use the information to respond to students' learning needs and to differentiate instruction, and communicate their findings to interested stakeholders. These activities are often embedded within a multistage assessment cycle. For example, Rea-Dickins (2001) describes the processes and strategies in classroom assessment according to a four-stage model: (a) planning, (b) implementation, (c) monitoring, and (d) recording and dissemination. TESOL (2001) envisions a similar, four-phase iterative cycle for classroom assessment consisting of (a) planning assessments, (b) collecting and recording information, (c) analyzing and interpreting assessment information, and (d) using information for reporting and decision making. Davison and Leung (2009) describe teacher-based assessment in a framework consisting of these steps: plan assessments, collect information about students' learning, make professional judgments, and provide appropriate feedback or advice. Each of these models consists of a series of activities within each stage of the process that conform to the principles of formative assessment outlined above.

The Value of Student Assessment

Students have been expected to step up to new levels of involvement in the assessment process through activities such as self- and peer assessments (Black & Wiliam, 1998; Colby-Kelly & Turner, 2007). For example, some teachers invite students into the assessment design process by engaging them in developing scoring guides with class-generated criteria and then in using the rubrics to assess their own or peers' performances. Learners reflect on their progress in journals and learning logs that document their experiences in learning and using language and create portfolios that illuminate progress in building skills.

Student self-assessment is an outgrowth of classroom assessment in which students create original work products in response to performance activities, tasks, or projects. Having students critically reflect on their own work by matching their performance against preset criteria validates their learning. Other benefits of student engagement in self-assessment include:

- having a venue for students to convey their depth of understanding,
- encouraging students to take responsibility for their own learning,
- honoring student input in the assessment process,
- recognizing students as a data source in making classroom decisions,
- fostering a shared set of expectations between teachers and students,
- motivating students to do their best work,
- helping students set realistic language and learning goals,
- promoting students to become life-long learners (Gottlieb, 2006).

Students can use self- and peer assessment to gather information about specific language performances as well as to generate a picture of a pattern of development over time. These assessments can also guide students in cultivating metacognitive awareness of their language development that helps facilitate the crafting of individual learning goals.

In their study of the effects of incorporating peer-assessment practices into English language programs, Cheng and Warren (2005) confirm that student involvement in assessment benefits learning and development, but caution that students must be prepared to take on the mantle of this new role through explicit training and practice in using assessment techniques. They suggest that including students in the design and development of assessment criteria might help students feel more comfortable in using peer assessment. They further note that such assessment procedures have a better chance of succeeding if teachers commit to using them on a long-term basis by incorporating them into the culture of classroom practice.

The Role of Standards in Classroom Assessment

Although the discussion up to now has centered on decision making related to assessment at the classroom level, all classrooms exist in a wider context—at program, organizational, municipal, or state entity levels—that influences what occurs in the classroom. For more than two decades now, educational programs have witnessed the emergence of standards-based education initiatives that identify the content for instruction, target learning outcomes and specify learner achievement in terms of standards-related criteria as part of system-wide accountability efforts. This phenomenon has made an impact on language classrooms worldwide (Stoynoff & Chapelle, 2005) through major initiatives including the Common European Framework of Reference (Council of Europe, 2001) and the TESOL English Language Proficiency Standards (TESOL, 2006) as well as district, state, and countrywide language standards.

In implementing standards for language education, teachers struggle to reconcile externally developed expectations for learning expressed in standards and large-scale assessments with the pedagogical realities of their classroom contexts (Arkoudis & O'Loughlin, 2004). In some instances, schools have developed standards-referenced tests that teachers use in the classroom on a scheduled basis to track whether students are meeting benchmark criteria and, thus, are on a trajectory for success on year-end tests. However, many teachers continue to question whether assessments for accountability match the needs of learners or their own pedagogical purposes (Stoynoff & Chapelle, 2005).

Despite the challenges, student standards have become integrated into every aspect of educational life and, as such, affect decisions made in the classroom about learning. Although questions have arisen about the validity of the language descriptions contained in standards documents and the appropriateness of their expectations for diverse learners (McKay, 2006), standards have become the basis for creating curricula, aligning them with assessments and reporting classroom and school-wide data as well as grading student progress. In addition, standards-based assessment has become a topic of discussion for sustained professional development and communities of practice.

Conclusion

As the discussion up to now indicates, teachers play a crucial role in translating new ideas for assessment into effective classroom practices. They are expected to adapt emerging theories and techniques in assessment—such as engaging students in developing their skills in self- and peer assessment—to their individual classrooms and the language needs of their students. Emphasizing the importance of their role is the addition of *teacher-based assessment* (Davison & Leung, 2009) to the roster of terms describing alternative methods of language testing. Although teachers are essential to this process of adapting assessment approaches to local instructional contexts, a burgeoning literature has pointed out that

teachers are not necessarily well prepared either through teacher preparation programs or professional development opportunities to take on this role (Cumming, 2009). Thus, it is not surprising that teachers struggle with the competing demands of responsibility for incorporating classroom assessments into instruction while also preparing students for external large-scale tests required for accountability. While classroom assessment offers the promise of enhanced learning opportunities, additional research is needed to describe classroom practices that will help teachers deliver on those promises. These concerns notwithstanding, emerging perspectives on the dynamic interplay between teaching and learning that is mediated through assessment recognize the inherent value in classroom assessment and the formative information it yields. Through a participatory and interactive assessment process, teachers and students play integral roles in promoting meaningful assessment practices as part of students' language development within the classroom.

Assessment of Academic Language for Specific Purposes

DAN DOUGLAS

A test of academic language ability is one that is intended to assess “the ability to operate successfully in the [language] used in the academic domain” (Davies, 2008, p. 1). Davies goes on to elaborate on academic language proficiency later in the book:

it is the language of coherent argument where implications are understood and inferences made. It is, above all, a discourse in which, as reader, as listener, as speaker and as writer, the candidate makes sense of what has gone before and responds, and continues to respond appropriately. (p. 113)

Thus Davies does not define academic language in terms of its vocabulary or syntax, but rather in discursal terms, requiring recognition of implicature and inference. Defining the theoretical construct of academic language more specifically has been problematic, as has defining any branch of language for specific purposes. In a similar conceptualization of specific purpose language as that employed in discourse in academic situations, Bailey (2006a) argues, “In some regard, it is not meaningful to conceive of *language* as either social or academic, rather it is the *situation* that is either predominately social or academic” (p. 9), and she characterizes the language used in academic situations as involving the more frequent use of “complex grammatical structures, specialized vocabulary, and uncommon language functions” (Bailey, 2006a, p. 9). It is important to note, too, that not all language assessments used in academic situations are tests of academic language ability. For example, the National Matriculation English Test (NMET), used in China for purposes of university admission, though given to arguably the largest single language testing population in the world at around 10 million each year, tests the more general English as is taught in schools (Cheng & Qi, 2006) rather than the language used in English-medium academic institutions.

The field of academic language assessment encompasses the language used both in universities and colleges and in primary and secondary schools. The assessment of academic English is dominant in the field, though there are certainly training and assessment programs in academic languages other than English (e.g., Wahba, Taha, & England, 2006). It should be noted, too, that the assessment of *academic* language involves more than the assessment of language for *pedagogical* purposes, which, as Spolsky (1995) puts it, is “any form of testing used by a teacher or learner to check on the learner’s progress in order to modify the course or nature of instruction” (p. 7). A major use of tests of academic language is as proficiency measures for admission to university studies. Moreover, with regard to the assessment of academic language in schools (as opposed to tertiary institutions), over the years, it has been particularly susceptible to the “mandating of assessment as a tool for the achievement of specific political goals” (McNamara & Roever, 2006, p. 204). Davies (2008) argues that there are two major traditions in the assessment of academic language, the British/European linguistic/work sample-based tradition, in which test tasks are similar to those involved in the academic situation, and embodied in the International English Language Testing System (IELTS), and the US psychometric-based tradition, exemplified

by the Test of English as a Foreign Language (TOEFL), although the distinction has become increasingly blurred owing to recent developments in each of these testing programs.

The first part of this entry will discuss current research on the two major tests of academic English, the IELTS and the TOEFL, followed by a review of research into various academic language skills, including reading, writing, listening and speaking, as well as integrated skills tests. After a brief look at academic language tests in schools, it will conclude with a summary of where the field of academic language assessment seems to be moving.

IELTS and TOEFL

There has been a great deal of research in recent years on both of these tests, much of it sponsored by the test development agencies themselves: Cambridge ESOL Assessment in the case of IELTS, and Educational Testing Service in the case of TOEFL. With regard to IELTS, Davies (2008) describes the development of British academic English testing from its inception in the 1950s to its current manifestation in the IELTS program, arguing that academic English assessment has developed along with our understanding of language and language learning and with a recognition that practical matters of test administration, delivery, and analysis are as important as more theoretical concerns. In this regard, a computer-based IELTS became operational in May 2005, though candidates are offered the choice of taking either the computer-based (CB) or the traditional paper-based (PB) version. Even if they opt for the computer version, they may further choose to write their essay by hand (Jones & Maycock, 2007). Both the paper-based and the computer-based tests have been shown to produce equivalent scores, irrespective of computer familiarity: "candidate ability and experience in using computers was not found to have any significant impact on the difference between PB and CB scores for any of the tested skills" (Maycock & Green, 2005, p. 6). The IELTS academic module contains assessments of all four skills, but only the reading and writing tests specifically assess academic English; the listening and speaking tests are common to both academic and general training test takers and are thus not specifically academic in content. The IELTS program publishes a series of research reports, the abstracts of which are available online (IELTS, 2009), and which may be purchased through the same website. Cambridge ESOL publishes a periodical, *Research Notes*, containing articles relevant to IELTS. These may be accessed freely online at Cambridge ESOL (2010). Finally, Cambridge University Press publishes a research series, *Studies in Language Testing*, which contains many titles relevant to IELTS. The IELTS writing test underwent revision, particularly with regard to the assessment criteria and scales, between 2001 and 2006 (Shaw, 2006), focusing on enhancing the validity and reliability of the writing assessment process. Studies by Weir and colleagues (Weir, Hawkey, Green, & Devi, 2009; Weir, Hawkey, Green, Devi, & Unaldi, 2009) investigated aspects of the IELTS reading module with respect to actual reading required of first year students in British universities, and the cognitive processes underlying IELTS reading tasks.

Perhaps the most significant change in the TOEFL program in the last few years was the introduction in 2005 of the Internet-based TOEFL (TOEFL iBT). The result of several years of planning, research, and development, the iBT is more academically oriented than previous versions of the TOEFL (Chapelle, Enright, & Jamieson, 2008; Alderson, 2009) and contains a speaking component in addition to listening, reading, and writing. The test is also characterized by having, in addition to the usual "independent" speaking and writing tasks, *integrated* modality tasks in which test takers listen to or read, or both listen to and read some input and then are prompted to either speak or write a response that integrates information from the input. In addition to independent speaking and writing tasks, there are two read/listen/speak tasks and two listen/speak tasks, and there is one read/listen/write task. The integrated tasks have been shown to tap the intended academic English

constructs of speaking and writing, respectively, very well (Sawaki, Stricker, & Oranje, 2009). Research on the iBT is published in various report series at Educational Testing Service (ETS), including the *TOEFL iBT Research Series*, *TOEFL Research Reports*, *TOEFL Technical Reports*, and *TOEFL Monograph Series* (available online at ETS 2010). The focus of many of these publications is on gathering evidence to support validity claims concerning various components of the TOEFL. With regard to the reading subtest, Cohen and Upton (2007) conducted a study of response strategies employed by test takers, particularly investigating the extent to which they believed they were carrying out *academic* reading tasks as opposed to test tasks. The authors concluded that

the primary goal of the subjects was to get the answers right, not to necessarily learn, use or gain anything from the texts read. Thus, for these respondents, working their way through the reading sections of the *LanguEdge* test did not truly constitute an academic reading task, but rather a test-taking task with academic-like aspects to it. (p. 237)

Thus, the authors argue that this finding indicates that the TOEFL reading tasks do in fact require test takers to use academic-like reading skills though not truly engaging in academic reading.

There is also, of course, a great deal of research activity in the assessment of academic language outside the IELTS and TOEFL programs. In an interesting study of how the use of multiple-choice questions affects the definition of the academic reading construct, Rupp, Ferne, and Choi, (2006) found that response processes “deviate significantly from those predicted by a model of reading comprehension in non-testing contexts” (p. 469). This finding would appear to complement what Cohen and Upton found in their TOEFL reading study. Gebril (2009), in a study of reading-to-write assessment tasks in Egypt, found that scores on such tasks provided more generalizability than did the use of a single writing task based solely on test takers’ background knowledge, providing more support for the use of integrated tasks in writing assessment. Lee and Anderson (2007) conducted a study of the relationship between writing test performance and test takers’ academic major and found that major was not related to writing performance, although there was variation more generally in topic difficulty. In a study comparing performance on standard individual writing tasks with that on paired collaborative writing tasks, Wigglesworth and Storch (2009) found that collaboration improved accuracy but did not affect fluency or complexity. Finally, writing about academic language test development, Read (2008) provides a look at the use of assessments to diagnose the academic language needs of students.

Researchers have tackled the difficult issue of the effect of the co-construction of discourse in paired speaking assessment tasks (again, recall the point made in the introduction about academic language as discourse). Brooks (2009) found more complex interaction in paired tasks contrasted with interview tasks which are largely monologic and reactive (recall Davies’s characterization above of academic language as discourse). The paired tasks produced more negotiation of meaning, consideration of the interlocutor and more complex output. This may be compared to the paired writing task reported on by Wigglesworth and Storch above, which did not result in more complex output. Following the same theme of paired speaking tasks, May (2009) found that raters viewed the performance of the two test takers as mutual achievements and awarded shared scores as a result. May interprets this as an acknowledgement of the co-constructed nature of the discourse. Taking a different view of co-construction of discourse, Sawaki (2007) studied a criterion-referenced test of Spanish for academic purposes, analyzing two role-play tasks. Her results generally confirmed the highly correlated nature of the analytic rating scale (pronunciation, vocabulary, cohesion, organization, and grammar), highly dependable ratings, and a strong contribution of grammar in the composite score variance, an intentional design feature.

Academic Language Assessment in Schools

In an overview of language assessment in education, Cumming (2009) notes that while academic language tests have traditionally focused on normative proficiency levels for purposes of certifying abilities, screening for admission to higher education, and monitoring the results of education systems, more recently, the focus in many school systems has shifted to a criterion-referenced assessment according to benchmark standards specifying goals for education, achievement, and program accountability. In this regard, it is important to understand more accurately the nature of academic language use in schools, as some of the articles in Bailey (2006a), for example, indicate. In an article urging the reconsideration of the responsibility of test developers and score users for the investigation of impact of tests in schools, Chalhoub-Deville (2009) argues that language test developers should focus on what beneficial impacts they want to achieve with their assessments and then design measures that will achieve those goals. She introduces a concept of *social impact analysis* to promote the proactive rather than a reactive approach to impact.

There are, of course, many studies of language assessments in schools outside of the US context of the No Child Left Behind legislation of 2001. For example, Jones and Saville (2009) report on the proposed use of the Common European Framework of Reference (CEFR) as a model for learning in schools across Europe. They argue that if the framework is used without reference to the diversity of the many European educational contexts, in other words, as a prescriptive agenda for language education, the result will be negative impact on teaching and learning. However, they also argue for the framework's "flexible and context-amenable" nature (p. 51) and look ahead to the use of the CEFR in the achievement of comparability of standards across languages and educational systems.

Conclusion

In this brief review of the assessment of academic language for specific purposes, it is noted that the definition of the academic language construct is really more related to situation than to linguistic features. This suggests that the assessment of academic language involves, as Davies (2009) points out, assessing ability to understand the language of argument and implication, make appropriate inferences, and respond appropriately. Further specifying the language of academic argument, Bailey (2006b) notes that while it contains no *different* features than does more social, non academic language, it does more frequently employ complex structures, technical vocabulary, and uncommon functions. Academic language is found, not surprisingly, in the two domains of colleges/universities and primary/secondary schools, though the purposes of assessment are rather different in the two domains. Tests associated with higher education tend to focus on normative assessment for admission, placement, and progress, while those in schools, particularly more recently, are more likely to emphasize criterion-referenced assessment for administrative benchmarking and public accountability. Another observation is that while there is indeed a broad range of tests of academic languages other than English, English is the dominant language assessed owing to its current place in the world as a *lingua franca*, particularly among mobile professionals and academics.

Although the two largest academic language assessment programs, IELTS and TOEFL, both maintain a paper-based testing program, both also offer their tests via computer, either locally or on the Internet. Collecting evidence to support the validity of computer-mediated assessment has occupied researchers in both programs in recent years, looking at the relationship between performance on paper-based tests versus that on computer-based tests, the effect of computer familiarity on test performance, and washback and

impact studies. Another area of research in the TOEFL program in particular has involved the use of integrated skills tasks in speaking and writing, where test takers read or listen to input and then speak or write about it. Outside the IELTS and TOEFL programs, recent research has focused on the co-construction of discourse in collaborative writing and speaking tasks and how it affects rating of test taker performance. In school-based academic language assessment in the USA, research has been dominated by the No Child Left Behind legislation and a resulting focus on standards and progress, while elsewhere there has been more interest recently in formative assessment to impact teaching and learning.

What of the future of academic language assessment? As an Arabic proverb has it: he who foretells the future lies, even if he tells the truth. However, there are some areas where one may look forward with some confidence. Davies (2009) draws attention to the growing place in international communication of world Englishes (WE), local varieties of English. WE are often the medium of spoken interaction in academic settings in many parts of the world and logically may well need to be assessed in those settings. A second area that may see an increase in the future is, paradoxically, the assessment of academic languages other than English. As noted in the introduction to this entry, there are already a number of programs and assessments in various academic languages worldwide, and one may imagine the need for such programs increasing as even more students and scholars move more freely about the academic world. Finally, in language assessment generally and particularly in academic language assessment there is a trend toward increased attention to ethics, the use of tests in a gate-keeping function, and impact, the effect tests have on educational, social, and political systems. Academic language tests have a great potential for having life-changing influences on individuals and thus must be developed, administered, and interpreted with great attention to evidence that inferences and decisions made on their basis are appropriate and supported by acceptable evidence. Tests are increasingly being used as instruments as much of political and social power as they are of educational reform and monitoring. We have a responsibility to make our tests of academic language ability as valid, reliable, and fair as we can make them.

Assessment of Cultural Knowledge

R. MICHAEL PAIGE AND ELIZABETH STALLMAN MADDEN

Introduction

This entry examines the ways in which cultural knowledge is currently being defined and how it is being assessed. The context for this entry is the long-standing interest in applied linguistics and related disciplines, such as intercultural communication, education, psychology, and anthropology, in how culture can be taught and learned. The substantial growth in the field of international educational exchange during the past 20 years has heightened this interest in language and culture learning, and the research and applied literatures have expanded accordingly (Lange & Paige, 2003). Related to this growth is the development of new cultural knowledge assessment instruments (Paige, 2004; Fantini, 2009).

In this entry the authors provide a conceptual map of the ways in which cultural knowledge is being defined and assessed. In the "Conceptualizing Cultural Knowledge" section, the literature on cultural knowledge is reviewed to provide a foundation for the discussion of assessment instruments. In the next section, "The Nature of Instruments Assessing Cultural Knowledge," the dimensions being assessed are examined in greater detail and assessment instruments related to those dimensions are identified. In the following section, "Selected Cultural Knowledge Assessment Instruments," five instruments are selected as exemplars of those categories and discussed in greater detail.

It is important to note at the outset that much of what is being discussed in this entry is coming from disciplines other than the applied linguistics or language education fields. This is not to discount the substantial body of knowledge linking language and culture (Kramsch, 1998; Lange & Paige, 2003; Byram, 2008), but to acknowledge the focus of the authors on culture per se. In addition, it needs to be acknowledged that this entry condenses decades of theory and research, hence necessarily simplifies the very complex topic of cultural knowledge and assessment.

Conceptualizing Cultural Knowledge

Paige's (2006) description of *culture learning* serves as one of the frames of reference for this entry. He describes culture learning as a process of acquiring and acting upon five primary dimensions of cultural knowledge including: (a) *cultural self-awareness*—explicit knowledge of one's own preferred values, beliefs, patterns of behavior, and cultural identity; (b) *knowledge of culture*—knowing the elements of culture, both objective and subjective; (c) *culture specific knowledge*—knowing about a particular culture other than one's own; (d) *culture general knowledge*—knowledge about intercultural transitions and experiences, and how to manage them; and (e) *culture learning*—knowing how to learn about another culture (2006, pp. 40–1).

The interrelated concepts of *intercultural sensitivity*, *intercultural development*, and *intercultural competence* (Bennett, 1993; Hammer, 2008a), separate from the five culture concepts mentioned above, are also central to the assessment of cultural knowledge. These terms describe, in various ways, what it ultimately means to be effective in communicating and

2 ASSESSMENT OF CULTURAL KNOWLEDGE

interacting across cultures. For Bennett (1993), intercultural sensitivity “is the construction of reality as increasingly capable of accommodating cultural difference” (p. 24). Bennett’s “developmental model of intercultural sensitivity” (DMIS) conceptualizes intercultural sensitivity as a developmental phenomenon consisting of six primary orientations toward cultural difference organized into three “ethnocentric” (Denial, Defense, Minimization) and three “ethnorelative” (Acceptance, Adaptation, and Integration) orientations. According to Hammer (2008a), intercultural competence is “The capability of shifting cultural perspective and adapting behavior to cultural context” (p. 205). Intercultural development refers to the movement through this continuum from ethnocentrism to ethnorelativism and the increasing capacity to shift one’s frame of cultural reference, cognitively and behaviorally.

The DMIS has been highly influential and of great value to educators working in culturally diverse settings because it provides a way of (a) understanding the challenges being experienced by persons living in those situations and contexts, and (b) designing programs that will support intercultural development that are relevant to the learners’ existing level of competence. The Intercultural Development Inventory (IDI; Hammer, Bennett, & Wiseman, 2003; Hammer, 2008a) described below is a valid and reliable measure of Bennett’s developmental continuum.

The Nature of Instruments Assessing Cultural Knowledge

Consistent with the multidimensional ways in which cultural knowledge is being conceptualized, there is a wide variety of assessment instruments that measure different aspects of cultural knowledge. Fantini (2009) identifies 44 “external assessment instruments” that can be used to measure intercultural competence. Paige (2004) describes 35 “intercultural instruments” that are organized into nine culture categories. Five of those are particularly relevant for this section: (a) intercultural development, (b) cultural identity, (c) cultural values, (d) cultural adjustment, and (e) culture learning (“learning styles” in Paige, 2004).

Intercultural Development

Bennett (1993) authored the “developmental model of intercultural sensitivity” that is now considered to be the seminal work on intercultural development. At the Adaptation and Integration levels of development, Bennett theorizes that individuals have the capacity to shift cognitively and behaviorally to another culture’s frames of reference, what Hammer (2008a) refers to as “intercultural competence.” This concept of intercultural competence has received considerable attention in the literature, valuable recent works being those by Deardorff (2009), Moodian (2008), and Savicki (2008). The best known instrument for measuring intercultural development as represented by the DMIS is the IDI (Hammer, 2008a), which is described in greater detail below.

Cultural Identity

Cultural identity refers to the sense a person has of belonging to and identifying with one or more cultural communities as well as to knowledge of one’s own cultural values. Numerous instruments have been developed over the years to assess ethnic-specific forms of identity, such as the Cross Racial Identity Scale (Cross & Vandiver, 2001) and the Suinn-Lew Asian Self-Identity Acculturation Scale (Suinn, Rickard-Figueroa, Lew, & Vigil, 1987). More generalizable scales also have been developed that allow the respondents to identify their primary culture and discuss the strength of their participation in it. Examples include the Multi-Index Ethnocultural Identity Scale (MEIS; Yamada, 1998) and the Multigroup Ethnic Identity Measure (MEIM; Phinney, 1992), which is described below.

Cultural Values

A central component of culture is the cultural value system, that is, ideas that are shared by members of a culture group regarding the desired patterns of behavior and belief in their community. Seminal authors in this area include Kluckhohn and Strodtbeck (1961), Hofstede (2001), and Hall (1969). Well-known intercultural instruments measuring cultural values include the Values Orientation Inventory (Kluckhohn & Strodtbeck, 1961), Intercultural Sensitivity Inventory (Bhawuk & Brislin, 1992), and Intercultural Conflict Style Inventory (Hammer, 2008b).

Cultural Adjustment

Cultural adjustment is a core concept in the intercultural field (Ward, Bochner, & Furnham, 2001). Having culture general knowledge about adjustment and adaptation is seen as central to working effectively across cultures. Adjustment and adaptation are such significant aspects of the intercultural experience that a vast training literature has been developed around the issues of preparing and supporting persons experiencing cultural adjustment (Paige, 1993; Landis, Bennett, & Bennett, 2004). Well-known instruments that measure cultural adjustment include the Cross-Cultural Adaptability Inventory (Kelley & Meyers, 1999) and the Sociocultural Adjustment Scale (SCAS; Ward & Kennedy, 1999). The SCAS is one of the instruments described below.

Culture Learning

In recent years, a number of instruments have been developed to assess the skills, strategies, and capacities needed for learning about another culture. Kolb (1984) presents a comprehensive theoretical treatment of culture learning, in which he identifies core learning styles and then discusses their importance in learning about another culture. The Culture Learning Strategies Inventory (CLSI; Paige, Rong, Zheng, & Kappler, 2006) and the Cultural Intelligence Scale (CIS; Earley & Ang, 2003) fall into the culture learning category and are described in the following section.

Selected Cultural Knowledge Assessment Instruments

In this section, five instruments are discussed in greater detail. These instruments were chosen because they each meet four criteria that we deemed critical for a sound assessment or research project. These criteria are: theoretical and conceptual foundation; the aspect of cultural knowledge being assessed; evidence of instrument reliability and validity; and generalizability to a broad and culturally diverse audience. We define generalizability to be the use and application the instrument has for several culture groups, language groups, or both. Table 1 shows a summary of each instrument and how it meets each of these five criteria.

The Intercultural Development Inventory

Conceptual foundation. The IDI is a 50-item measure of intercultural competence that is based on Bennett's (1993) developmental model. The IDI is well known and frequently used for assessing intercultural development and intercultural competence.

Cultural dimension(s) being measured: intercultural development. The IDI assesses the cognitive complexity of one's orientation toward culturally different persons and groups. At higher levels of intercultural sensitivity or competence, this necessarily means possessing cultural knowledge sufficient for shifting cultural perspective and adapting behavior to

4 ASSESSMENT OF CULTURAL KNOWLEDGE

Table 1 Culture learning instruments and selection criteria

Criteria	Instrument				
	<i>Intercultural Development Inventory</i>	<i>Multigroup Ethnic Identity Measure</i>	<i>Sociocultural Adjustment Scale</i>	<i>Culture Learning Strategies Inventory</i>	<i>Cultural Intelligence Scale</i>
Conceptual foundation	Developmental Model of Intercultural Sensitivity (Bennett, 1993)	Ethnic identity development (Phinney, 1989)	Sociocultural adaptation (Ward & Kennedy, 1999)	Multiple: intercultural relations, intercultural communication, international education	Cultural intelligence (Earley & Ang, 2003; Sternberg, 1986)
Cultural category	Intercultural development	Cultural identity	Cultural adjustment	Culture learning	Culture learning
Reliability and validity	+	+	+	+	+
Generalizability	Across culture and language groups	US ethnic minorities	Across culture groups	Across culture groups	Across culture groups

Note. + indicates instrument meets reliability and validity testing. See instrument description for details.

cultural context. Version 3 of the IDI (the current version) generates an overall score for intercultural competence, the “developmental orientation” (DO) score, as well as subscale scores for Denial, Polarization (Defense), Polarization (Reversal), Minimization, Acceptance, and Adaptation. It also produces a distinct “cultural disengagement” (CD) score.

Reliability and validity. There is considerable empirical evidence on the reliability and validity of the IDI (Hammer et al., 2003). These studies show that (a) the items possess strong internal reliability consistency, (b) the IDI is not subject to social desirability bias, (c) the IDI has predictive as well as construct validity, and (d) it is not correlated with standard background characteristics of age, gender, or ethnicity.

Generalizability. The IDI has strong cross-cultural generalizability. The items were originally generated by a culturally diverse sample and the IDI was pilot tested with a culturally diverse group. It has been translated into 12 languages (using a rigorous back translation method).

Multigroup Ethnic Identity Measure

Conceptual foundation. The MEIM (Phinney, 1992) is conceptualized around the multidimensional, social aspects of an individual’s ethnic identity, including sense of belonging and affirmation, ethnic identity achievement, ethnic behaviors and practices, and orientation to other groups. Its theoretical base is Phinney (1989) on ethnic identity development.

Cultural dimension being measured: cultural identity. The MEIM measures “that part of an individual’s self-concept which derives from [his] knowledge of [his] membership of a social group (or groups) together with the value and emotional significance attached to that membership” (Tajfel, in Phinney & Ong, 2007, p. 271).

Reliability and validity. The latest research on the MEIM (Phinney & Ong, 2007) has resulted in a six-item measure that meets reliability ($\alpha > .83$) and validity standards. It is

currently a two-factor model, *exploration* of and *commitment* to one's ethnic identity.

Generalizability. The MEIM is intended to be used (and has been tested with) ethnic minorities in the USA. Such minorities have included Latino, Asian American, African American, European American (such as Armenian), and those of mixed heritage.

Sociocultural Adjustment Scale

Conceptual foundation. The SCAS is a 29-item instrument designed to measure the cognitive and social aspects of sociocultural adaptation (Ward & Kennedy, 1999). Sociocultural adaptation consists of two dimensions: *cognitive adaptation* (the ways in which persons think about a different culture) and *behavioral adaptation* (the ways persons respond to a different culture).

Cultural dimension(s) being measured: cultural adjustment. The SCAS measures cultural knowledge in a general manner; while it is not a measure of concrete culture-specific knowledge, it does ask respondents to evaluate what they know about particular aspects of the specific culture.

Reliability and validity. The reliability and validity of the SCAS have been well established. Ward and Kennedy (1999), summarizing the results from 21 different samples, demonstrate that the instrument has strong internal consistency reliability as well as convergent, factorial, and criterion validity.

Generalizability. The phenomenon of intercultural adaptation has been shown to occur in virtually all cross-cultural transitions and for all culture groups experiencing a new culture (Kim, 2001). The concept is therefore generalizable and the SCAS, through the testing mentioned above, is also generalizable as an instrument for use across culture groups.

Culture Learning Strategies Inventory

Conceptual foundation. The CLSI (Paige et al., 2006) is the first instrument to explicitly identify strategies for learning culture. It includes 60 items that measure the culture learning strategies persons use and the degree to which they use them. Its theoretical framework resides in the intercultural relations, intercultural communication, and intercultural education literatures.

Cultural dimension being measured: culture learning. The CLSI is principally about how elements of culture can be learned. The 60 items pose learning strategy questions related to nine aspects of culture: adapting to culturally different surroundings; culture shock/coping strategies; interpreting culture; communicating across cultures; communication styles; nonverbal communication; interacting with culturally different people; homestay strategies; and reentry strategies.

Validity and reliability. Paige, Cohen, and Shively (2004), report the results of validity and reliability testing of the CLSI. Internal consistency reliability coefficients range from .72 to .86. Confirmatory factor analysis shows that the conceptual structure is a sound fit with the data.

Generalizability. Because of the comprehensive theoretical structure of the instrument, the CLSI should be applicable to diverse audiences.

Cultural Intelligence Scale (CQS)

Conceptual foundation. Cultural intelligence is a multidimensional concept researched and developed by Earley and Ang (2003) and has its roots in intelligence theory as posited by

Sternberg (1986). It is a culture-general construct defined as “an individual’s capability to function and manage effectively in culturally diverse settings” where diversity lies in race, ethnicity, and nationality (Ang et al., 2007, p. 336).

Cultural dimension(s) being measured: culture learning. The CQS measures culture in four aspects: (a) strategy, or assessing and analyzing intercultural experiences; (b) knowledge, or understanding of culture as a concept that transcends specific national or ethnic traits; (c) motivation, or desire to interact with people of other cultures; and (d) behavior, or a person’s ability to respond appropriately in different cultural contexts.

Reliability and validity. Confirmatory factor analysis results show goodness of fit for the authors’ theoretically based, four-factor model (chi-square = 381.28 (164 *df*)) and reliability tests for each factor were at least 0.77. Ang et al. (2007) and Van Dyne, Ang, and Koh (2009) found that the instrument predicts task performance and interactional adjustment.

Generalizability. As a culture-general instrument, the CQS is designed to be used effectively by people of different cultures. It has also been tested with participants from at least 12 countries.

Conclusion

This entry shows that cultural knowledge is a multifaceted concept and that many assessment instruments are available that measure the different dimensions of cultural knowledge. The goal of the authors has been to provide a conceptual map of cultural knowledge, to identify a number of assessment instruments relevant to those categories, and, for illustrative purposes, to describe in greater detail five specific cultural knowledge assessment instruments. It is hoped that this entry can serve as a useful introduction to cultural knowledge and its assessment.

Assessment of Grammar

JAMES E. PURPURA

While language educators have always acknowledged the importance of grammar in second language (L2) teaching and testing, the notion of what it means to “know” the grammar of an L2 has evolved in many ways. Consistent with developments in L2 pedagogy, models of L2 proficiency used in assessment have shifted from a primary focus on decontextualized linguistic structures to an emphasis on measuring communicative language ability (CLA) through performance. In assessment, however, language testers have taken the de-emphasis on decontextualized linguistic structures to mean a near complete removal of grammar as a separate and explicit domain of measurement. Evidence of this is seen in the removal of separate grammar sections from the *IELTS* and *ibTOEFL*. Disinterest in separate grammar assessment stems in large part from unsubstantiated beliefs that learners demonstrating “functional” levels of communicative effectiveness do not need to be assessed on the linguistic elements. Other reasons arise from concerns that separate, explicit grammar assessments might lead (a) to teaching and assessment practices prioritizing grammatical accuracy over other components of CLA (e.g., sociolinguistic knowledge) or (b) to a return to measurement practices rooted in structural linguistics and discrete-point measurement of the 1960s.

Arguments against grammar were persuasive to educators including assessment specialists when some researchers (e.g., Krashen, 1982) wrongly discounted the effectiveness of explicit grammar instruction as a means of promoting L2 acquisition (SLA) and advocated for its abandonment. However, such arguments no longer hold given the empirical research showing that learners receiving form-focused instruction are more likely to learn at more accelerated rates and achieve higher levels of proficiency in grammar (Norris & Ortega, 2000; DeKeyser, 2007; Ellis, 2008) and pragmatics (e.g., Lyster, 1994) than learners not receiving form-focused instruction—especially if explicit, corrective feedback is provided (e.g., Russell & Spada, 2006). More recent research shows that grammatical knowledge, when defined in terms of form-meaning mappings, is not only a critical component of L2 knowledge, but also a strong predictor of the ability to communicate in semantically meaningful (Ameriks, 2009; Kim, 2009; Liao, 2009; Dakin, 2010) and pragmatically appropriate ways (Grabowski, 2009).

In assessment, the resurgence of interest in grammar stems from an acknowledgment that grammatical knowledge, defined in terms of form-meaning mappings, is always invoked during language use, and that grammar assessment provides information on the forms that L2 learners are able to use (or not) when they attempt to express meanings in context. Also, grammar assessment has recently been the focus of considerable attention in the use of natural language processing and speech and writing recognition and processing technologies for the purpose of developing automated scoring and feedback systems of writing and speaking assessments (Xi, 2010). Finally, grammar has never ceased to be the mainstay of most L2 classrooms or the central focus of second language acquisition (SLA) research. In short, these factors create opportunities to rethink the construct of grammatical knowledge in SLA and assessment research, and to reconsider ways of measuring this construct.

Clarifying Key Terms

Knowledge is used here to refer to informational structures stored in long-term memory. These structures exist in concepts, images, networks, representations, propositions, schemas, and representations (Pressley, 1995). Thus, *language knowledge* then refers to an internalized, mental representation of informational structures related to language, and *grammatical knowledge* to representations of form-meaning mappings in long-term memory. *Ability* involves not only informational representations in long-term memory, but also the capacity to *use* or *apply* informational structures to accomplish communicative tasks. This requires *strategic competence*, which involves the ability to use metacognitive and cognitive strategies in learning, use, and assessment (Purpura, 1999). *Language ability* (also *L2 proficiency*), is defined as a combination of language knowledge and strategic competence (Bachman, 1990), and communicative language ability (CLA) refers to the use of knowledge and strategies in context. *Grammatical ability*, defined as the capacity to use grammatical knowledge to accomplish tasks (Purpura, 2004), logically involves grammatical knowledge and strategic competence. *Language skill* references the ability to communicate with automaticity. Finally, *language performance* refers to manifestations of language ability in language use and *grammatical performance* to manifestations of grammatical ability in language use.

Representations of Grammatical Knowledge in SLA Research

The question of how grammar can be represented has been central in the study of SLA, but the approaches taken have been of limited direct use for language assessment. Many researchers, informed by interlanguage theory (Selinker, 1972), view L2 knowledge as an “internal linguistic system that a learner constructs at a single point in time (an ‘interlanguage’) and as the series of interconnected systems that characterize the learner’s progress over time (‘interlanguage’ or ‘interlanguage continuum’)” (Ellis, 2008, p. 409). This system has been conceptualized as an *increasingly complex set of grammatical rules* on a proficiency continuum, with beginners’ proficiency being characterized in terms of formulaic sequences, structural simplification, and semantic simplification (e.g., omission of articles).

Noting the static approach to representation implied by the interlanguage approach, some SLA researchers, most notably McLaughlin, Rossman, and McLeod (1983) and McLeod and McLaughlin (1986), explained L2 knowledge differentiation through declarative/procedural knowledge and information-processing approaches, based on concepts from cognitive psychology. Building on an information-processing approach, Skehan (1998) proposed an interesting model of L2 learning linked to a limited-capacity information-processing system. He described L2 representation as a dual-mode system involving both rule- and exemplar-based processing. Skehan proposes that the implications of such a processing model is that linguistic competence can be defined in oral production as *fluency* (e.g., number of words per turn), *accuracy* (e.g., percentage of error-free clauses), and *complexity* (e.g., amount of subordination), arguing that these factors align with a theory of language and language processing (Foster & Skehan, 1996; Skehan & Foster, 1997; Skehan, 1998). Such conceptualizations provide little information on how specific L2 knowledge might be defined, but the approach holds potential for describing the sociocognitive underpinnings of learning-oriented L2 assessments and for designing L2 assessments for, of, and through learning (Purpura, 2009; Purpura, Dakin, Ameriks, & Grabowski, 2010).

Another influential perspective on characterizing L2 knowledge of linguistic forms and language differentiation is in terms of explicit and implicit knowledge. Ellis (1994) defined “explicit L2 knowledge” as “conscious, declarative, anomalous, and inconsistent . . . and generally only accessible through controlled processing in planned language use”; “implicit L2 knowledge” referred to “intuitive, procedural, systematically variable, automatic, and

thus available for use in fluent, unplanned language use” (p. 418). Research attempting to find empirical evidence for this perspective has been inconclusive so that the notion of “grammatical proficiency” defined as distinct explicit/implicit knowledge components remains an open empirical question (Ellis, 2006).

Despite the texture and ingenuity of these and other lines of inquiry on grammar in SLA, in the majority of empirical studies in SLA (e.g., DeKeyser, 1995; Ellis, 2005), L2 knowledge is defined mainly in terms of grammatical form (explicit and implicit knowledge of morphosyntax). This syntactocentric depiction of grammatical knowledge raises questions about generalizability as this approach fails to consider other important aspects of grammatical knowledge (e.g., cohesion) as well as other aspects of language knowledge (e.g., pragmatics)—components that would be specified if this research were linked to a model of CLA.

**Representations of Grammatical Knowledge
in Language Assessment Research**

Applied linguists focused on language assessment (e.g., Lado, 1961; Canale & Swain, 1980; Bachman, 1990; Larsen-Freeman, 1991; Bachman & Palmer, 1996; Purpura, 2004) have proposed a variety of models of L2 proficiency, which include a grammatical component. While these models differ, each one conceptualizes grammatical knowledge as a critical communicative resource, whether it is described in terms of form or meaning.

Conceptualizing Grammatical Knowledge in Terms of Form

Rooted in structural linguistics and discrete-point measurement, the “traditional” approach to grammar assessment defines grammatical knowledge solely in terms of linguistic forms. Grammar is viewed on the (sub)sentential levels as a separate body of knowledge with discrete elements, deriving from an ad hoc list of phonological, lexical, and (mostly) morphosyntactic forms.

Grammatical Knowledge	
Grammatical Form	
Subsentential or Sentential Levels	Graphological or Phonological Forms (e.g., sound-spelling correspondences, segmental and prosodic forms)
	Lexical Forms (e.g., co-occurrence restrictions— <i>depend ON</i>)
	Morphosyntactic Forms (e.g., inflections, tense-aspect, word order)
Discourse Level	Cohesive Forms (e.g., substitution and ellipsis, deictic forms)
	Information Management Forms (e.g., given/new, clefts)
	Interactional Forms (e.g., discourse markers, fluency markers)

Figure 1 Grammatical knowledge as form. Adapted from Purpura (2004)

Nouns and noun phrases • pre-determiners, determiners, post-determiners • nouns (countability, affixation, compounding)	Pronouns & reference (cohesion) • personal, demonstrative, reciprocal • relative, indefinite, interrogative
Verbs, verb phrases, tense & aspect • tense—present, past, future; aspect—progressive, • subject–verb agreement	Questions & responses • yes/no, wh-, negative, uninverted • tags
Modals & Phrasal Modals (<i>be able to</i>) • forms—present, past, future, perfective, progressive • obligation—<i>should, supposed to</i>	Conditionals • forms—present, past, future • factual, counterfactual conditionals
Phrasal verbs • form—2-word, 3-word • separability	Passive Voice • form—present, past, future, perfective • other passives—<i>get something done</i>
Prepositions & prepositional phrases (PP) • co-occurrence w/V, Adj. or N—<i>rely on, fond of</i> • spatial or temporal relationships—<i>at the store at 5</i>	Complements & complementation • V + NP + (PREP) NP • infinitive/gerund complements—<i>want (him) to; believe him to</i>
Adjectives and adjectival phrases • formation (<i>-ous -ive</i>) • adj order—<i>the lovely, little, plastic Cher doll</i>	Comparisons • comparatives & superlatives • equatives—<i>as/so big as</i>
Logical connectors • relationships of time, space, reason & purpose, • subordinating & coordinating conjunctions	Adverbials and adverbial phrases • forms—adverb phrase, clause, PP • placement—sentence initial, medial & final
Relative clauses • Forms: animate, inanimate, zero, place • Subject NP, (in)direct object NP, genitive NP	Reported speech • backshifting; • indirect imperatives or questions
Nonreferential <i>It & There</i> • time, distance, environment—<i>it's noisy in here</i> • existence—<i>there is/are</i>	Focus & emphasis • Emphasis—emphatic <i>do</i>; • marked word order—<i>him I see</i>;

Figure 2 Taxonomy of grammatical forms. Adapted from Purpura (2009)

To make this approach more useful for assessment, Purpura (2004) proposed a model of grammatical knowledge specifying how forms might be organized on the (sub)sentential and discourse levels. This model accounts for graphological/phonological, lexical, morphosyntactic, cohesive, information management, and interactional forms (Figure 1).

Each category can be further specified to be used in developing content specifications for grammar assessments that aim for content representativeness. Figure 2 presents an abbreviated version of Purpura's (2009) taxonomy of grammatical forms.

This form-based approach to grammar assessment provides the potential for fine-grained information about a wide range of structures across proficiency levels. This approach has, therefore, served well in assessment contexts such as placement into intensive language programs and as a component of proficiency tests aiming to make reliable distinctions among examinees. At the same time, however, a form-based approach is conspicuously narrow in scope because in language use a form can rarely be disassociated from its meaning potential (Jaszczolt, 2002). In other words, a form-based approach fails to address adequately how forms are resources for conveying ideas, information, and other propositions (semantic meaning), or how they encode social status, formality, culture, affect, stance,

or other implied meanings in communication (pragmatic meanings). The limitation with a form-based approach is especially evident in cases where meaning extensions can only be derived from context and are dependent upon an understanding of shared norms, assumptions, expectations, and interlocutor presuppositions. More seriously, the meaning dimension must be considered if the importance of communicating effectively is prioritized over the importance of communicating in flawless grammar. Finally, the meaning dimension must be addressed if assessment is to provide appropriate, corrective feedback since, in some cases, learners may have mastered the form, but not the meaning, or vice versa. Or they might understand the forms and associated semantic meaning without seeing how these meanings can be extended or made intentionally ambiguous as in a joke.

Conceptualizing Grammatical Knowledge in Terms of Meaning

Aiming to include the meaning potential of grammatical knowledge, Purpura (2004) argued that a comprehensive model would minimally include both the form and meaning dimensions of grammatical knowledge, which in turn would provide resources for pragmatic use (Figure 3). Although much of language use involves the conveyance of pragmatic meanings, the current discussion is limited to the assessment of grammatical knowledge.

Grammatical forms encode the following graphological/phonological, lexical, morpho-syntactic, cohesive, information management, and interactional meanings, as seen in Figure 4.

Each individual meaning can obviously be tested separately. Consider a context in which a dispatcher calls a doctor asking for emergency medical services. The doctor replies: “I *work* with injured patients” (my regular job is to do this work) instead of “I’m *working* with injured patients” (and am therefore unavailable at the moment). The first response, while accurate, is an example of miscommunication, resulting from a presumed knowledge gap in the connection between morphosyntactic form and meaning (tense-aspect). Pedagogical decisions related to the previous response would be different from those made from the following: “I *working* with injured patients,” where the message was communicated despite the inaccurate form. In assessment terms, each response represents a different knowledge gap, which has direct implications for scoring and corrective feedback.

Besides the meanings of the individual components, the collective meaning of an utterance—that is, the learner’s ability to get a point across *meaningfully*—can be assessed. When grammatical forms combine with their individual meanings in a well-formed utterance, they express a proposition, referred to as the semantic (or propositional) meaning of the

Figure 3 Grammatical knowledge and pragmatic use. Based on Jaszczolt (2002) and Wedgwood (2005)

Grammatical Knowledge		
Grammatical Form		Semantic Meaning
Discourse <-----> (Sub)sentential Levels	Graphological or Phonological Forms (e.g., sound-spelling correspondences, segmental and prosodic forms)	Graphological or Phonological Meanings (e.g., homophony (their/there), contrastive stress, minimal pairs, tags)
	Lexical Forms (e.g., co-occurrence restrictions— <i>depend ON</i>)	Lexical Meanings (e.g., denotations & connotations, polysemy)
	Morphosyntactic Forms (e.g., inflections, tense-aspect, word order)	Morphosyntactic Meanings (e.g., time/duration/completion, passivization)
	Cohesive Forms (e.g., substitution and ellipsis, deictic forms)	Cohesive Meanings (e.g., referential links, conclusion/contract)
	Information Management Forms (e.g., given/new, clefts)	Information Management Meanings (e.g., emphasis/focus, foregrounding)
	Interactional Forms (e.g., discourse markers, fluency markers)	Interactional Meanings (e.g., hedging, alignment, disagreement)
<i>Low Context <-----> High Context</i>		

Figure 4 Model of grammatical knowledge. Adapted from Purpura (2004)

utterance. Propositional meaning is encoded in all utterances. However, as utterances are expressed in context, characterized by various situational and interpersonal features, utterances also encode the speaker’s intended meaning (e.g., compliment), also referred to as the conveyed meaning, speaker’s meaning, utterance meaning, communicative intent, functional meaning, illocutionary meaning, or propositional intent. The literal and intended meaning of an utterance may be exactly the same (e.g., direct speech acts). More commonly, they differ (e.g., indirect speech acts), thereby creating the potential for ambiguity in low context situations. The referral here is to an utterance’s combined literal and intended meaning as the semantic (or grammatical) meaning. In the situation above, if the doctor had replied: “*I working with some injure patient,*” the semantic meaning would have been conveyed, demonstrating communicative success. Communicative precision would then be the focus of further instruction. In sum, the degree to which meaning is conveyed is intrinsically part of grammatical knowledge and should be explicitly assessed, separately or in combination with form.

**Measuring Grammatical Knowledge in
SLA Research and Language Assessment**

To measure grammatical knowledge, learners are presented with tasks allowing them to demonstrate their receptive, emergent, or productive knowledge of grammar. Tasks involve a collection of characteristics that vary on several dimensions (Bachman, 1990). These

Selected-Response Tasks	Constructed-Response Tasks			
	Limited Production	Extended Production		
• noticing (circle the verbs) • matching • same/different • true/false • agree/disagree • judgment tasks (grammaticality, acceptability, naturalness, formality, appropriateness) • multiple choice • MC error identification • ordering • categorizing • grouping	• labeling • listing • gap-filling • cloze • sentence completion • discourse completion task (DCT) • short answer	Product-Focused • essay • report • project • poster • portfolio • interview • presentation • debate • recital • play	Performance-Focused • Simulation • role-play • improvisation • interview Recasts • retelling • narration • summary Exchanges • information gap • reasoning gap • opinion gap • jigsaw • problem-solving • decision-making • interactive DCT	Process-Focused • Observation • checklist • rubric • anecdotal report • Reflection • journal • learning log • think aloud

Figure 5 Ways of eliciting grammatical knowledge. Adapted from Purpura (2004)

variations elicit performance variability that can be construct-relevant (i.e., related to grammatical knowledge) or construct-irrelevant (e.g., related to unclear instructions). In other words, since tasks interact with examinee characteristics (i.e., their grammatical knowledge, strategic competence, personal attributes, topical knowledge, affective schemas), they logically impact performance. The choice of grammar tasks should be selected according to the assessment purpose. Labeling task types, such as multiple-choice (MC) tasks, as inappropriate or undesirable is not informative for assessment specialists; instead, assessment tasks need to be designed in view of the assessment purpose.

In designing tasks for grammar, assessment specialists find it useful to categorize them according to the type of elicited response (Figure 5). Selected-response (SR) tasks present input in the form of an item, requiring examinees to choose the response. These tasks aim to measure recognition or recall. While SR tasks are typically designed to measure one area of grammatical knowledge, they may engage more than one area (*form and meaning*). Constructed-response (CR) tasks elicit language production. One type of CR tasks, limited-production (LP) tasks, presents input in the form of an item, requiring examinees to produce anywhere from a word to a sentence. These tasks aim to measure emergent production, and are typically designed to measure one or more areas of knowledge. Another type of CR tasks, extended-production (EP) tasks, presents input in the form of a prompt, requiring examinees to produce language varying in quality and quantity. EP tasks are designed to measure full production, eliciting several areas of knowledge simultaneously.

SR (and some LP) tasks are typically scored right/wrong for grammatical knowledge based on one criterion for correctness (e.g., accurate form). Scoring criteria might include: accuracy, precision, range, complexity, grammatical acceptability, meaningfulness, appropriateness, or naturalness. Dichotomous scoring assumes that an item invokes *only one* underlying dimension of knowledge, that it is measuring full knowledge of the feature,

and that item difficulty resides *only* in the interaction between the stem and key, *but not* with the distractors. In some cases, however, response choices may reflect *complete knowledge* of a form, *partial knowledge*, *misinformation*, or a *total lack of knowledge*. If the distractors represent “partial” knowledge of the feature, the use of *partial credit scoring* should be considered, as dichotomous scoring would deflate test scores by failing to reward examinees for partial knowledge (Purpura et al., 2010). In the case of grammaticality judgments, grammatical acceptability would need to depend on form alone—only one criterion for correctness to score the item appropriately. If meaning is *also* affected, dichotomous scoring is not appropriate.

Partial credit scores with LP responses are based on the dimensions of knowledge being measured (e.g., 1 point for form, 1 for meaning), or they can be linked to an analytic or holistic rating scale and rated by judges. Rating scales provide hierarchical descriptions of observed behavior associated with different levels of performance related to some construct. While rating scales are efficient for many contexts, the information derived from these assessments may be too coarse-grained for others—especially when detailed feedback is required. The more focused the descriptors are for each rating scale, the greater the potential for measurement precision and useful feedback. For further discussion of grammar scoring, see Purpura (2004).

While SLA researchers sometimes use SR and LP tasks to measure grammatical knowledge, the preference is often for EP tasks in which the targeted forms arise naturally and essentially during L2 production. EP tasks have also been used to elicit L2 use under different processing conditions (e.g., planning/no planning) so that a learner’s L2 production can be examined under these conditions. Once elicited, the L2 data may then be scored with rating scales, as described above. More commonly in SLA research, however, grammatical knowledge is inferred from L2 production data described in terms of accuracy, fluency, and complexity. In examining the development of writing ability, Wolfe-Quintero, Inagaki, and Kim (1998) provided a comprehensive list of measures to examine written production. They defined *accuracy* as “error-free production” (p. 117), measured by the frequency of occurrence of errors or error types within a production unit (e.g., error-free T-units), by ratios (e.g., error-free T-unit per T-unit) or by accuracy indices (e.g., error index). They defined *fluency* as “the rapid production of language” (p. 117), measured by the frequency of occurrence of specified production units (e.g., words in error-free clauses) or by fluency ratios (e.g., words per T-unit or clause). They defined *complexity* as “the use of varied and sophisticated structures and vocabulary” (p. 117) in production units. Grammatical complexity involved linguistic features (e.g., subordination) in clause, T-unit, and sentence production units, measured by the frequency of occurrence of these features (e.g., clauses), by complexity ratios (e.g., T-units per complexity ratio), and by complexity indices (e.g., coordination index). Lexical complexity was measured by lexical ratios (e.g., word variation/density). Skehan and Foster (1997) produced a similar list of measures for oral production data.

While these measures provide important information on the varied characteristics of L2 production, it is unclear how over a hundred such measures, individually or collectively, relate to a model of grammatical knowledge or how these measures address the conveyance of different types of meaning in communication. Given the seemingly random nature of these atomistic measures, their syntactocentric focus, and the impracticality of using them with large sample sizes, testers have largely ignored these L2 production measures in operational assessment contexts. Nonetheless, for those wishing to characterize features of L2 production data, such as in assessment validation research or in automated scoring contexts, rather than assess knowledge of L2 grammar, these measures serve a valuable purpose.

Conclusion

In examining how grammatical knowledge has been conceptualized and assessed in applied linguistics, this entry has argued that grammatical knowledge defined uniquely in terms of form presents only a partial understanding of the construct, since forms are intrinsically related to the conveyance of semantic and pragmatic meanings. It also argues that in the assessment of communicate effectiveness, the focus might be better placed on the use of grammatical ability for meaning conveyance, rather than solely on accuracy of the form. Finally, test developers need to consider the many options for constructing grammar tasks in view of the intended test score interpretation and use.

Assessment of Integrated Skills

LIA PLAKANS

Assessment of integrated skills refers to the use of test tasks that combine two or more language skills to simulate authentic language-use situations. In such assessment, task demands aim to overlap and synthesize combinations of reading, writing, listening, and speaking. Although possibly more common in classroom assessments, such tasks are now included in large-scale tests, for example:

1. Internet-Based Test of English as a Foreign Language (TOEFL iBT) from Educational Testing Service is employed as a measure of English-language use and comprehension in university classroom contexts for the purpose of admission into English-speaking higher education programs. This test includes tasks that integrate writing with reading and listening as well as speaking tasks that include reading and listening.
2. *Diplôme approfondi de langue française* (DALF), managed by the Centre international d'études pédagogiques, is used as a French-language proficiency measure for university study and employment. The high proficiency level assessment integrates multiple skills—reading, writing, listening, and speaking—with tasks such as summarization, discussion, and argumentation.
3. US College Board's Advanced Placement (AP) Spanish Examination is given to determine if college foreign-language credit in Spanish can be granted to students completing high school. Writing tasks include an integrated essay based on reading two texts and listening to an audio file.

The approach to skills integration illustrated by these three tests differs from “integrative” tests of the past, which aimed to assess a unitary language-proficiency construct that was largely grammatically driven (Oller, 1983; Chalhoub-Deville & Deville, 2005). One well-regarded integrative format popularized in the 1950s is the cloze test (Oller, 1979), which provides a portion of text with certain words removed either mechanically (every *n*th word) or selectively, and test takers are asked to supply the missing words. For example:

In addition, many scholars believe that reading ____ a second language parallels reading ____ a first language. Thus if you have ever studied the process ____ native language reading, you will find many similarities _____ this chapter. (Horwitz, 2008, p. 131)

This concept of a unitary construct of language ability competed with the idea that it is valuable to separate language ability into component skills for assessment practices (Lewkowicz, 1997; Chalhoub-Deville & Deville, 2005; Leki, Cumming, & Silva, 2008). The conceptualization of language as four skills, plus grammar and vocabulary, has been a mainstay in language testing for some time. The current trend of integrated skills assessment may on the surface appear to return to the earlier notion of integrative assessment but in fact the construct assessed and the format of the test tasks for integrated tests today are very different from those of integrative testing of the past.

Test Tasks

A description for an integrated writing task from the Test of English as a Foreign Language Web site clarifies the types of test tasks that allow for skill integration:

Via computer delivery, examinees are given some time to read and take notes on a reading passage. Then they listen to a lecture and are allowed to take notes on it. Afterward the reading passage reappears and examinees are directed to summarize the points made in the lecture (which they don't see) and explain their relationship to the points made in the reading. They are given 20 minutes to key in their responses. (Retrieved and excerpted from http://www.ets.org/Media/Tests/TOEFL/pdf/ibt_writing_sample_responses.pdf)

As in this example, in most cases, integrated assessment tasks are performance based, leading to writing or speaking, rather than completion of selected response items such as multiple-choice questions. The integration of skills in assessment may occur during the process of composing the constructive response, such as in a speaking task that includes summarization; to complete the task the test taker is required to combine the cognitive processes involved in reading and speaking. Integrated tasks may also require that the final product from the task include integration; for example, the TOEFL task requires that content from the listening and reading texts be combined in the written summary.

Integrated tasks may be categorized into at least three types: text- or content-responsible, stimulus-related, and thematically linked. A text- or content-responsible task (Leki & Carson, 1997; Leki, Cumming, & Silva, 2008) requires the test taker to write or speak about the content of texts. Examples might include an oral summarization task or a persuasive essay that requires test takers to use ideas from source texts for supporting evidence. The prompt below illustrates a content-responsible task.

Read the following passage that gives an opinion about technology. Then explain the writer's main point and why you agree or disagree with it.

Computer Madness

Technology has not fulfilled the promises made when computers were first adapted for personal use. They have made life more complicated and increased the amount of work we do, rather than simplify life or minimize workloads. In one day, I must respond to at least fifty emails. Sometimes these emails are things that would not even warrant a phone call. Instead of meeting face-to-face, my meetings are online involving video cameras, microphone, etc. Time is spent in setting up the technology rather than in making important decisions. I am really starting to wonder if there is any advantage to having modern technology. Where are the benefits?

These tasks are common in assessment for academic purposes as well as in content-based instruction where language is used as a medium for learning, for example in language-immersion programs or sheltered instruction. Such assessment requires that test takers comprehend the reading and incorporate it into their response. If the answer could be completed without reading the text, then it might fall into the second category: stimulus test tasks.

A stimulus task asks test takers to read or listen to a text but does not require that the content be present in their performance. The input texts or visuals, such as lists, charts, or graphs, serve as idea generators or background information (Leki & Carson, 1997). The example below presents a stimulus task given at the end of an ESL course.

Read the following pieces of advice about successful study skills.

General suggestions for study skills

- Write down due dates for all assignments on a calendar.
- Determine weekly goals for studying and focus on meeting them.
- Study in a room where you have complete silence and can concentrate.
- At the end of each study session, plan what to do for your next session.
- Reward yourself for working hard.

Imagine you are writing to a classmate who will take this class in the future. What other study skills will you suggest that are specific for this class? What helped you succeed? Provide three suggestions with some explanation and an example for each. Write approximately 600–700 words on this topic; write essay style, not just listing. Your response will be evaluated on the following: organization, development, clarity, and grammatical accuracy.

These two task types, content-responsible and stimulus-related, differ in what they require test takers to do and how the resulting performance is rated. A stimulus task integrates skills in the process only; for example, a test taker may need to comprehend the source texts and plan a response on the topic, but does not have to integrate the texts in the product of the assessment. In content-responsible integrated tasks, both the process and the products require skill integration, and, therefore, the score should include criteria for the use of more than one skill.

The third test type considered is integrated assessment, which includes several test sections that are thematically linked (Esmaeili, 2002). For example, a section assessing reading comprehension would include a text that is also the topic for a subsequent writing prompt. The relationship between the tasks could either be stimulus-related or content-responsible. Several rationales may be provided for thematically linked tasks. First of all, topics in listening or reading tasks that reappear in performance tasks provide test takers with content on which to build their performance. In addition, including reading or listening comprehension questions about a source text can add to the integrated measure information about the test takers' skills in isolation, which may allow efficiency in testing. However, thematically linked tasks that include content-responsible performances have been criticized for twice penalizing test takers with low language-comprehension skills: for example, they will likely receive a low score on reading questions and, due to their low comprehension of the text, may also be limited in their ability to use the content in a performance.

Research in the Assessment of Integrated Skills

Researchers have attempted to understand integrated tasks by comparing test takers' performances on them with their performances on tasks requiring only one skill. Research comparing independent and integrated writing task performance has found that overall scores show similarities (Brown, Hilgers, & Marsella, 1991) and are positively correlated (Watanabe, 2001; Gebriel, 2009). Yet closer investigation of discourse features has revealed some differences, such as grammatical accuracy, development, and rhetorical stance (Cumming et al., 2005). For example, in studying the prototype TOEFL iBT task, Cumming et al. (2005) found that integrated task responses were shorter, but used longer words and more variety in words when compared to independent writing tasks. The independent writing responses were scored higher in certain rhetorical features, such as the quality of propositions, claims, and warrants. Watanabe (2001) found that integrated essays were less likely to have an original thesis when compared to an independent task essay.

Studies investigating the test-taking process across tasks types have found evidence that some test takers follow a similar approach for both independent and integrated tasks, while others treat integrated tasks as requiring synthesis and integration strategies, such as scanning the text for ideas to include in their essay (Plakans, 2008, 2009). However, the study of test-taking processes on two different integrated tasks also revealed differences across tasks: Ascención (2005) found that read-and-respond writing tasks required more planning and monitoring than a read-and-summarize task.

Researchers have also attempted to reveal effects of proficiency and task familiarity on integrated task performance. Not surprisingly, higher-proficiency writers produce longer responses to integrated writing tasks than lower-level writers (Cumming et al., 2005; Gebril & Plakans, 2009). Expected differences in grammatical accuracy also occur across levels of proficiency, as well as in organization and the use of integration source texts (Watanabe, 2001; Cumming et al., 2005; Gebril & Plakans, 2009). Research results also suggest that prior experience with integrated tasks, educational level, first-language writing experience, and interest in writing may affect performance (Ruiz-Funes, 2001; Ascención, 2005; Plakans, 2009). In a study of task representation—how writers interpret the demands of a task—Plakans (2010) found that writers with more experience in source-text writing recognized that an integrated task held different requirements than an independent task, compared to writers with less experience.

The role of texts is also important for developing integrated assessment, as well as for understanding scores. In a study of different source texts used in summary writing, Yu (2009) found that source-text characteristics had a significantly greater effect on writers' scores than language proficiency. Although somewhat inconsistently, writers reported that features of the source texts, such as organization, unfamiliar words, length and topic, affected their summarizing. Both Cumming et al. (2005) and Watanabe (2001) found significant differences in how sources are used by test takers across topics and texts.

Benefits of Integrated Assessment

The current interest in the profession for integrating skills for assessment resides in their apparent authenticity. Particularly for specific purposes such as assessing academic language, needs analyses of language use have shown that skills are used in tandem rather than in isolation (e.g., Leki & Carson, 1997). Thus, including this integration as part of assessment creates test tasks that appear authentic in view of their alignment with real language-use contexts (Feak & Dobson, 1996). The connection between the test and the real world is intended to result in a positive impact on test users' confidence in the scores, increase test takers' motivation, and lead to scores that are more predictive of future performance. Also beneficial are integrated assessments that provide test takers with content or ideas for their performances, thus mitigating non-language factors such as creativity, background knowledge, and/or prior education (Read, 1990). Some research has reported that test takers prefer integrated tasks because they understand the task topic better than they do on single skill tasks and may generate ideas from the sources given (Plakans, 2009; Huang, 2010). However, Huang (2010) found that actual performance and anxiety measures did not support test takers' perceptions that integrated tasks lower anxiety in comparison with independent speaking task.

Another advantage with this kind of assessment is the emphasis on the skills working together rather than viewing them as individual components of language ability. Integrated assessment may fit well with current language-teaching approaches, such as task-based language teaching (TBLT), which move away from teaching separated skills to focusing on accomplishing tasks using language holistically. Such tests may also have a positive

washback, or impact, on classrooms that integrate skills, focus on content-based learning, or have goals for specific purposes language use.

Challenges of Integrated Assessment

Although visible benefits exist with integrating skills in assessment, a number of challenges remain, such as developing high-quality integrated tasks, rating learners’ performance appropriately, and justifying the validity of interpretations and uses.

Development

Developing high-quality integrated prompts can be challenging because these tasks are often complex, including multiple steps and texts. The development or selection of source texts requires decisions to be made about the length and level of the text as well as about the content. For example, some tests include multiple texts that give different opinions on a topic while others have one long text that describes a single phenomenon. When test developers aim to produce parallel items these considerations about texts need to be taken into account. Carefully crafted instructions are an important consideration. Test takers need a clear idea of what is expected and, as much as possible, of how to integrate the skills in their process and product. Studies have shown that test takers approach these tasks in a variety of ways, some using both skills to complete the tasks while others use only one skill and thus are not truly integrating. With more frequent use, test takers’ confusion may decrease; however, those unfamiliar with the type of assessment may struggle to understand how to complete the task, which can affect their score regardless of their language ability.

Reliability and Rating

Although several studies have found assessment of integrated skills tasks can lead to reliable rating (Ascención, 2005; Gebril, 2009), the issue of scoring these performance-based tasks remains difficult. The rubric for integrated skills assessment needs to reflect skill integration in some way (De Fina, Anstendig, & De Lawter, 1991) unless there is a clearly dominant skill that is of primary concern, such as with stimulus tasks or thematically linked tasks that are not content-responsible. Thus, a clear definition of the role of the integrated skills and the evidence of them in the performance is needed for meaningful scoring. The example below presents a detailed rubric checklist for assessing integrated reading and writing skills.

	No evidence		Highly competent	
1. Comprehends main idea in the text	1	2	3	4
2. Distinguishes details and key ideas	1	2	3	4
3. Paraphrases ideas from source text appropriately	1	2	3	4
4. Selects ideas from the source text well	1	2	3	4
5. Connects ideas from source text with own	1	2	3	4
6. Clearly develops a thesis position	1	2	3	4
7. Provides support for position	1	2	3	4
8. Follows logical organization and cohesion	1	2	3	4
9. Displays grammatical accuracy	1	2	3	4
10. Uses clear specific vocabulary	1	2	3	4

When test takers are required to draw on texts in their performance, they may copy strings of words verbatim from others or plagiarize (Cumming et al., 2005; Gebril & Plakans,

2009), which makes these tasks difficult to rate and affects score interpretation. For some test takers, such borrowing may be a strategy, needed because of low reading comprehension, hesitancy in expressing themselves in writing, or a lack of experience with source-text integration (Yu, 2008). However, skills required by some types of integrated reading-writing include selecting ideas from texts to include in one's writing, choosing when to paraphrase or quote from the text, and including appropriate citation. Therefore, test developers need to consider how these skills appear in the construct for integrated tasks, and rating rubrics need to address how to score such writing; for example, the rubric above includes the descriptor, "Paraphrases ideas from source text appropriately," which could include source-text copying.

Validity

Validity of test-score interpretation and use needs to be justified on the basis of evidence for a correspondence between test scores and the integrated ability that the test is intended to measure, as well as evidence for the utility of the test scores. Test developers and researchers need to consider how to elicit evidence in order to conduct validation research. When dividing language into skills areas, defining the construct appears manageable; questions arise, however, with the construct underlying integrated assessment. With this goal in mind, several studies have investigated reading-to-write tasks to determine how much of the integrated test score can be predicted by scores on reading-comprehension measures, finding low statistical significance (Trites & McGroaty, 2005; Delaney, 2008). However, in studies of integrated task composing processes, the cognitive processes and strategies involved in reading are clearly employed by test takers to complete the task, suggesting that reading skill is critical (Esmaeili, 2002; Plakans, 2009). The different results on the impact of reading may reflect how writing in integrated tasks is scored as well as the dominance of the performance skill in integrated tasks.

Examining writing processes in a thematically linked integrated assessment, Esmaeili (2002) concluded that reading and writing could not be viewed as stand-alone constructs. In a study of non-native and native English speakers, Delaney (2008) found that reading-to-write tasks elicited processes attributable to unique constructs that were not merely a combination of reading ability and writing skill, but also of discourse synthesis. Plakans (2009) also found evidence of discourse synthesis in writers' composing processes for integrated writing assessment and concluded that the evidence supported interpretation of such a construct from test scores. Using structural equation modeling and qualitative methods, Yang (2009) found complex interrelated strategies used by writers in reading-listening-writing tasks, further supporting the idea that the processes related to discourse synthesis (selecting, connecting, and organizing) improved test performance. While research into validity and integrated assessment is building momentum, a clear definition is yet to be determined and more research is needed.

Conclusions

Integrating skills in assessment will benefit from continued investigation as well as creative innovation. It represents a step away from defining language as four skills plus grammar and vocabulary, which is a familiar way of dividing up the job of evaluating second or foreign languages. Since integration appears in classroom and authentic contexts (Hirvela, 2004), its emergence or re-emergence in testing seemed inevitable. Meanwhile, research should continue to look at the integrated skills as constructs to better understand how they can best be defined and measured and how scores from assessments of integrated skills can be used.

Assessment of Listening

GARY J. OCKEY

Listening is important for in-person communication with estimates that it accounts for more than 45% of the time spent communicating (Feyten, 1991). Listening continues to become more important in virtual environments with the increase of communication through such technologies as video broadcasting and Skype. It follows that teaching and assessing the listening skill of second language learners is essential. Unfortunately, the assessment of second language listening comprehension has attracted little research attention (Buck, 2001), and as a result, understanding of how to best assess it is limited.

Listening Processes

Current conceptions of the listening process maintain that comprehension results from the interaction of numerous sources of information, including the acoustic input and other relevant contextual information. The mind simultaneously processes these incoming stimuli and other information such as linguistic and world knowledge already present in the mind. Listening comprehension is a dynamic process, which continues for as long as new information is made available from any of these sources (Gruba, 1999; Buck, 2001).

Storage and retrieval of linguistic information are important in understanding listening comprehension. According to Johnson-Laird (1983), linguistic input is stored in the mind, either as propositional representations or mental models. Propositional representations include a concept along with something that relates to it, often a noun accompanied by a verb, whereas mental models are composed of concepts such as events, objects, people, and situations. Because propositional representations require considerable memory, information is stored more frequently as mental models. This means that listeners remember the information in a text—not the specific grammar and vocabulary used to express it.

Listening is multidimensional but is comprised of related discrete lower-level ability components. While agreement on a comprehensive list of these components has not been reached (nor does there exist an agreed-upon theory of how these components operate with each other), some research indicates that listening ability may include three lower-level abilities: the ability to understand global information, comprehend specific details, and draw inferences from implicit information (Min-Young, 2008). Test developers typically draw upon these in defining a listening construct in the first stages of test development.

Factors Affecting Listening

Professionals take into account factors that affect listening comprehension when they design and use listening assessments. One of these factors is rate of speech (Zhao, 1997; Brindley & Slatyer, 2002). When listeners comprehend authentic oral communication, they process a large amount of information very rapidly, which can result in cognitive overload or push working memory beyond its capacity. This means that listeners may not be able to understand input at faster speeds which can, however, be processed at slower speeds. Research also indicates that background knowledge about the topic is important for the message to

2 ASSESSMENT OF LISTENING

be comprehended. Test takers with background knowledge on a topic related to the input are generally advantaged. Jensen and Hansen (1995), however, found that the effect is not so simple, reporting that particular topics and test tasks can influence the relationship between background knowledge and test performance.

Accent of the speaker is another important factor that affects listening comprehension. Research has shown that it is easier for language learners to understand familiar accents (Pihko, 1997; Tauroza & Luk, 1997), standard dialects (Pihko, 1997; Major, Fitzmaurice, Bunta, & Balasubramanian, 2005), and native speakers (Major, Fitzmaurice, Bunta, & Balasubramanian, 2002).

Other important factors of oral communication known to affect listening comprehension include prosody (Lynch, 1998), phonology (Henricksen, 1984), and hesitations (Freedle & Kostin, 1999). Brindley and Slatyer (2002) also identify length, syntax, vocabulary, discourse, and redundancy of the input as important variables.

Types of interaction and relationships among speakers are also important factors to take into account when designing listening assessment inputs. Monologues, dialogues, and discussions among a group of people are all types of interaction that one would be likely to encounter in real-world listening tasks. Individuals might also expect to listen to input with various levels of formality, depending on the relationship between the speaker and the listener.

Tasks for Assessing Listening

Decisions about the characteristics of the desired listening assessment tasks should be based on the purposes of the test, the test takers' personal characteristics, and the construct that the test is designed to measure (Bachman & Palmer, 2010). Buck (2001) provided the following guidelines concerning listening tasks, which may be applicable to most listening test contexts: (a) listening test input should include typical realistic spoken language, commonly used grammatical knowledge, and some long texts; (b) some questions should require understanding of inferred meaning (as well as global understanding and comprehension of specific details) and all questions should assess linguistic knowledge—not that which is dependent on general cognitive abilities; and (c) test takers' background knowledge on the content to be comprehended should be similar. The message conveyed by the input, not the exact vocabulary or grammar used to transmit the message, as well as various types of interaction and levels of formality should also be assessed.

In practice, listening assessment tasks require learners to listen to input and then provide evidence of comprehension by responding to questions about the information conveyed in the input. The most common types of comprehension questions are selected response items, including multiple-choice, true/false, and matching. For these item types, test takers are required to select the most appropriate answer from options which are provided. These options may be based on words, phrases, objects, pictures, or other realia. Selected response items are popular, in part, because they can be scored quickly and objectively. An important question to answer when designing selected response item types is whether or not to provide people with the questions and possible responses prior to the input, especially since including them has been shown to favor more proficient test takers (Wu, 1998). Some researchers have argued that to have a purpose for listening, test takers should be provided with the questions prior to the input (Buck, 2001), while others argue that providing a preview of questions and answer options may decrease the authenticity of the task by changing the way learners process the input. For instance, when test takers are allowed to preview questions and answer options on multiple-choice tests, they have been found to use a "lexical-matching strategy," in which learners, particularly those who are less

proficient, listen for key words that they see in the distracters rather than striving for general comprehension of the message (Yanagawa & Green, 2008).

Constructed response item types are also commonly used. They require test takers to create their own response to a comprehension question and have become increasingly popular. These item types require short or long answers, and include summaries and completion of organizational charts, graphs, or figures. For example, for summary tasks, test takers listen to an input and then are expected to provide either a written or spoken synopsis of the input. Guidelines for the intended amount of detail to be included in the summary are generally provided. Constructed response item types have been shown to be more difficult for test takers than selected response item types (In'nami & Koizumi, 2009) and may therefore be more appropriate for more proficient learners. Most test developers and users have avoided using constructed response item types because scoring can be less reliable and require more resources. Recent developments in computer technology, however, have made scoring productive item types increasingly more reliable and practical (Carr, 2006), which may lead to their increased use.

Another listening task used in tests today is sentence repetition, which requires test takers to orally repeat what they hear, or the analogous written task of dictation, which requires people to write what they hear. As with constructed response items, computer technology has made the scoring of sentence repetition and dictation more objective and practical. Translation tasks, which require test takers to translate what they hear in the target language into their first language, is also a popular task used for assessing listening, especially when all those being assessed have the same first language.

Limitations of Listening Assessment Tasks

Validly assessing second language listening comprehension presents a number of challenges. The process of listening comprehension is not completely understood, and there are currently no methods which allow a view of the listener's brain to see what has been comprehended. Instead the listener must indicate what has been understood. The medium of this indication, along with other factors, has potential for diminishing the validity of listening assessments.

The majority of listening tasks require test takers to select responses from given choices or to use speaking, reading, or writing skills to demonstrate comprehension of the input. For instance, most forms of multiple-choice, true/false, matching, short-answer and long-answer items require test takers to read the questions and make a selection or provide a written response, while other tasks—such as sentence repetition—require oral responses. The need for learners to use other language skills when their listening is assessed can lead to scores that are not representative of their listening abilities. For example, some people have much more developed aural/oral skills than literacy skills. These individuals may be able to understand oral input but be assigned a lower score than expected on a listening test that requires them to read and respond to written comprehension questions. Moreover, poor oral ability, such as unclear pronunciation, may unfairly impact scores on tests which require provision of verbal responses to indicate listening abilities.

Strategies and other abilities not generally defined as part of a listening comprehension construct may also lead test takers to achieve scores that are not representative of their listening abilities. For instance, some learners may be able to eliminate wrong answer options or even select the correct answer by using test-taking strategies, such as selecting the longest answer to increase their chances of getting an answer to a multiple-choice item correct. Another problem with sentence repetition and dictation tasks is that people with well-developed sound recognition skills may be able to repeat the sounds they hear or write letters that correspond to the words they hear without comprehending the information.

Scores on listening assessments are compromised in various ways depending on the task test developers choose to use. Therefore, listening assessment developers and users should take into account the abilities of the test takers and limitations of the tasks used to best ensure that the test provides a valid indication of learners' listening abilities.

Computers in Assessing Listening

Developments in computer technology expand the potential for different types of listening input and ways of determining comprehension of input. For instance, technology allows acoustic signals to be easily accompanied by various types of input such as visual stimuli, which can make tasks more realistic.

Computers also increase the potential for using test items that require short constructed responses. Developers create model answers and identify the key words and phrases in them, and then these key words and phrases, along with acceptable synonyms, can be used to create a scoring algorithm. Responses to items that contain part or all of the targeted information can be given partial or full credit (Carr, 2006). Longer constructed item types such as summaries can also be rated by computers, but require more sophisticated programming. Computer-generated scoring systems based on speech recognition technology can be used for this purpose (Zechner, Bejar, & Hemat, 2007).

Computer technology may, however, have a negative effect on the assessment of listening. The tendency to use technology because it is available and attractive may lead to assessments that do not validly measure listening comprehension (Ockey, 2009). For instance, including attractively colored interfaces or interesting sounds, which are not part of the message to be comprehended, may be distracting to some test takers. Such distractions could lead to invalid scores for affected individuals. Moreover, computer scoring systems cannot make human judgments that may be important when assessing language (Condon, 2006). It is therefore important that test developers who use computers to assess listening recognize the strengths and limitations of this technology.

Current and Future Directions in Assessing Listening

An increasing number of researchers support listening assessments which include as much contextual information in the input as possible (Gruba, 1999; Buck, 2001; Ockey, 2007; Wagner, 2010). Of particular interest to most of these researchers is that the acoustic signal be accompanied by associated visual stimuli, such as a video which shows the speaker. To provide guidance to test developers and users, various types of visuals have been distinguished and researched, including context and content visual stimuli. Context visuals are intended only to establish the situation for the discourse and indicate change in speakers, while content visuals provide visual information which coincides with the audio input. Such information includes graphs, charts, and maps that commonly accompany acoustic input when a speaker wants to describe or explain something (Ginther, 2002).

Studies which have investigated people's use of visual information when taking a listening test have been revealing. The results of these studies suggest that individuals make use of visual information to varying degrees. Ockey (2007) found that with context-only video, test takers engaged to vastly different extents, with some reporting a great deal of use of the visuals, others reporting little or no use, and still others indicating that the visuals were distracting them from "listening." Rhetorical signaling cues (movements or expressions of the speaker) have also been shown to be important in listening comprehension (Dunkel & Davis, 1994). Jung (2006) found that second language learners misinterpreted texts more commonly when rhetorical signaling cues were excluded from the input. Wagner

(2010) found that test takers achieved higher scores on video than on audio-only tests when actors used gestures to help with explanations. Ockey (2007) found that individual test takers report using various types of rhetorical signaling cues, including lip movements, facial gestures, and hand movements. Evidence of the importance of these cues for processing information comes from Wagner's (2008) study. He reports that some test takers mimic gestures that they see in video input when they are asked to verbalize what they have heard.

Research which has compared test takers' scores on audio-only assessments with tests that include visual stimuli as well as the audio input have produced mixed results. Some studies have found that including visuals leads to increased scores (Shin, 1998; Sueyoshi & Hardison, 2005; Wagner, 2010), while others have failed to find a difference in scores for the two conditions (Gruba, 1989; Coniam, 2000). Researchers report that some test takers do not even look at visuals accompanying the acoustic input (Gruba, 1989; Ockey, 2007), apparently believing that it will serve them better to devote their full attention to the answer options rather than to the visuals. Further research on the interaction among task and question types, visual inputs, and test taker personal characteristics is needed to steer test developers who are planning to use visuals in their listening assessments.

Not all researchers support the notion that listening assessments should be designed to include context. In fact, some maintain that listening is an aural-only skill which should be tested with the minimum amount of context possible (Choi, Kim, & Boo, 2003). Proponents of this view contend that contextual cues such as visual information should be excluded from listening assessments. Test developers and users need to decide on the degree to which contextual information should be included in listening assessments, based on the construct that the test aims to measure.

Conclusions

Valid assessment of listening comes with many challenges and unresolved issues. A variety of types of input and tasks for assessing comprehension have been used, all of which have strengths and limitations. The quality of listening assessments should be evaluated based on the purpose of the test, the characteristics of the test takers, and the context in which the assessment will be given. Rapidly developing computer technology continues to increase the potential for item types that can better assess listening, but comes with its own limitations and challenges. Because all listening assessments have inherent strengths and weaknesses, test developers and users must agree on the listening construct that they desire to assess, and then use input and item types that will best assess it.

Assessment of Pragmatics

CARSTEN ROEVER

The assessment of second language pragmatics is a relatively recent enterprise. This entry will briefly review the construct of pragmatics, discuss some major approaches to testing pragmatics, and highlight some of the challenges for pragmatics assessment.

The Construct

The concept of *pragmatics* is far reaching and is commonly understood to focus on language use in social contexts (Crystal, 1997). Subareas include deixis, implicature, speech acts, and extended discourse (Mey, 2001). In terms of the psycholinguistic structure of pragmatic ability, Leech (1983) distinguishes between sociopragmatics and pragmalinguistics. Sociopragmatic ability describes knowledge and ability for use of social rules, including mutual rights and obligations, social norms and taboos, and required levels of appropriateness and politeness. Pragmalinguistic ability includes knowledge and ability for use of linguistic tools necessary to express speech intentions, for example, semantic formulae, hedging devices, and pragmatically relevant grammatical items.

Assessment instruments in second language (L2) pragmatics do not usually cover all possible subareas of pragmatics, and usually focus on either sociopragmatics or pragmalinguistics. A small number of tests have been developed as general proficiency tests, which are intended to compare test takers to each other and discriminate between test takers of different ability. These tests tend to provide the broadest (though not complete) coverage of the construct.

A second category of instruments are those that have been designed for research studies. They may serve as one-shot instruments to compare participants from different backgrounds (learning in the second vs. foreign-language context), or they may be used to establish a baseline of participants' knowledge of the feature of interest followed by a treatment (an instructional sequence or other exposure to the target feature) and concluding with a measurement of the effect of the intervening treatment phase. These tests tend to be narrower in their construct coverage as they are focused on a specific aspect of pragmatic competence, commonly a speech act (e.g., Bardovi-Harlig & Dörnyei, 1998; Matsumura, 2001; Rose & Ng, 2001; Takahashi, 2005) but sometimes also another feature, like implicature (Bouton, 1994; Taguchi, 2007, 2008b), discourse markers (Yoshimi, 2001), routine formulae (House, 1996; Roever, 1996; Wildner-Bassett, 1994) or recognition of speech styles (Cook, 2001).

The next section will concentrate on proficiency tests, but also discuss some tests from research settings that can inform future developments in the assessment of L2 pragmatics.

Proficiency Tests

The first large-scale test development project for L2 pragmatics was Hudson, Detmer, and Brown's (1992, 1995) test battery. They focused sociopragmatic appropriateness for the speech acts request, apology, and refusal by Japanese learners of English, and designed their instruments around binary settings of the context variables power, social distance,

2 ASSESSMENT OF PRAGMATICS

You are sharing a house with several people. Today you want to rearrange your room.
You need help moving a heavy desk and decide to ask one of your housemates. You go to
the living room where your housemate Jack is reading the newspaper.
You say: _____

Figure 1 DCT item

and imposition (Brown & Levinson, 1987). Hudson et al. (1992, 1995) compared several different assessment instruments, but like many studies in interlanguage pragmatics (Kasper, 2006) relied heavily on discourse completion tests (DCTs). A DCT minimally consists of a situation description (prompt) and a gap for test takers to write what they would say in that situation. Optionally, an opening utterance by an imaginary interlocutor can precede the gap, and a rejoinder can follow it. Figure 1 shows a DCT item intended to elicit a request.

Hudson et al.'s (1995) instrument included traditional written discourse completion tests (DCTs), spoken DCTs, where the task input was in writing but test takers spoke their response, multiple choice DCTs, role plays, and two types of self-assessment questionnaires. Test taker performance was rated on a five-step scale for use of the correct speech act, formulaic expressions, amount of speech used and information given, formality, directness, and politeness. This pioneering study led to several spin-offs. Yamashita (1996) adapted the test for native-English-speaking learners of Japanese, Yoshitake (1997) used it in its original form, and Ahn (2005) adapted it for Korean as a target language. In a review, Brown (2001, 2008) found good reliability for the role plays, as well as the oral and written DCTs and self-assessments, but the reliability of the multiple-choice DCT was low. This was disappointing as the multiple-choice DCT was the only instrument in the battery that did not require raters, which made it the most practical of all the components. Liu (2006) tried to develop a multiple-choice DCT for first language (L1) Chinese-speaking learners of English and reports high reliabilities but McNamara and Roever (2006) question whether test takers may actually have reacted to the idiomaticity of the response options rather than their appropriateness. Tada (2005) followed the tradition of investigating speech acts but used video prompts to support oral and multiple-choice DCTs and obtained reliabilities in the mid .7 range. Using conversation analysis as his theoretical basis, Walters (2004, 2007) developed DCTs, role plays and listening comprehension items to investigate learners' ability to comprehend and complete pre-sequences, compliments, and assessments. While innovative, his instrument was hampered by very low reliabilities.

While speech acts have been a feature of focal interest in the assessment of L2 pragmatics, not all work has focused exclusively on them. Bouton (1988, 1994, 1999) did pioneering work in the assessment of implicature, that is, how speakers convey additional meaning beyond the literal meaning of the words uttered. He distinguished two types of implicature, idiosyncratic and formulaic, with the former encompassing conversational implicature (Grice, 1975), whereas the latter includes some specific types of implicature, such as indirect criticism, variations on the Pope Q ("Is the Pope Catholic?") and irony. Bouton's test items consisted of a situation description, a brief conversation with an implicature, and multiple-choice response options offering possible interpretations of the implicature. Using this test, Bouton found that idiosyncratic implicature is fairly easy to learn on one's own but difficult to teach in the classroom, whereas the reverse is the case for formulaic implicature. Taguchi (2005, 2007, 2008a, 2008b) employed a similar instrument and took a psycholinguistic perspective on implicature, investigating learners' correct interpretation in conjunction with their processing speed.

Jack is talking to his housemate Sarah about another housemate, Frank.

Jack: "Do you know where Frank is, Sarah?"

Sarah: "Well, I heard music from his room earlier."

What does Sarah probably mean?

1. Frank forgot to turn the music off.
2. Frank's loud music bothers Sarah.
3. Frank is probably in his room.
4. Sarah doesn't know where Frank is.

Figure 2 Implicature item from Roever (2005)

Jack was just introduced to Jamal by a friend. They're shaking hands.

What would Jack probably say?

1. "Nice to meet you."
2. "Good to run into you."
3. "Happy to find you."
4. "Glad to see you."

Figure 3 Routines item from Roever (2005)

A small number of studies have combined assessment of different aspects of pragmatic competence. In the largest study to date that covers multiple features, Roever (2005, 2006) developed a Web-based test of implicature, routine formulae, and speech acts, and validated it using Messick's (1989) validation approach. Unlike Hudson et al.'s (1995) test, Roever's (2006) instrument focused on pragmalinguistic rather than sociopragmatic knowledge. Roever adapted Bouton's implicature test and a multiple-choice test of routine formulae from Roever (1996). Figure 2 shows an implicature item from Roever's (2005) test. Figure 3 shows a routines item from Roever (2005).

Roever also incorporated a section testing the speech acts request, apology, and refusal. He used rejoinders (responses by the imaginary interlocutor) in his speech act items, which Hudson et al. had discarded in their final version, but Roever argued that rejoinders do not detract from the tasks' authenticity in a pragmalinguistically oriented test because such a test assesses the breadth of test takers' pragmatic repertoire rather than their politeness preferences. Roever's test was Web-delivered with randomized presentation of items, capture of response times, automatic scoring of the implicature and routines section, and rater scoring of the speech act section. He obtained an overall reliability of .91 with a particularly high inter-rater reliability for the speech acts section where the rejoinders made it very easy for raters to assess responses dichotomously as correct (fitting the situation and the rejoinder) or incorrect. The more the score approaches 1.0, the greater the agreement between raters in their judgment of test taker performance. Roever's test covered the construct of L2 pragmatic knowledge in quite some breadth, and had a high degree of practicality due to its web-based delivery. However, like previous tests, it ignored the many other discursive abilities that language users need for successful communication in real time, such as reading and producing contextualization cues.

As part of the development of a comprehensive computer-based test battery, Roever et al. (2009) designed a "social language" section, which included a spoken DCT with requests, apologies, refusals and suggestions, and an implicature section with spoken implicature stimuli.

The instruments discussed above are the only ones to date that were designed as general proficiency tests of second language pragmatics, and none of them have been used on a large-scale operational basis. It is noticeable that they have overwhelmingly focused on speech acts (primarily request and apology) with implicature a distant second, which is probably due to the preoccupation with speech acts in interlanguage pragmatics research.

This focus goes back to the work of Blum-Kulka, House, and Kasper (1989), who developed a comprehensive coding approach for requests and apologies in the Cross-Cultural Speech Act Realization Project (CCSARP). However, their work has recently come under severe criticism (Kasper, 2006) as it was based strongly on the discourse-external context factors identified by Brown and Levinson (1987), atomized speech acts rather than consider them in their discursive context, and used DCTs, which have been shown to be highly problematic (Golato, 2003). This focus on isolated, atomized speech acts is a construct problem for proficiency tests of L2 pragmatics, which cannot be used to make claims about learners' ability to comprehend or produce pragmatically appropriate extended discourse.

A further curious effect of the DCT-based speech act tradition is the prevalence of measurement of productive rather than receptive abilities in L2 pragmatics testing, which is normally the reverse in other areas of second language assessment. Tests designed for research purposes offer some interesting approaches for expanding measurement of receptive skills and larger sequences of discourse.

Different Construct Emphases: Tests in Research Settings

Many tests in research settings used similar instruments as the proficiency tests discussed above, commonly discourse completion tests or role plays. Some projects, however, provide useful extensions to the construct as it has been assessed so far. Taguchi (2007, 2008a, 2008b) added the measurement of processing speed to interpretation of implicature, which is not part of the construct of most pragmatics tests but it is clearly an important aspect of real-time communication.

Other research instruments have examined learners' sociopragmatic judgment. Bardovi-Harlig and Dörnyei (1998) as well as their replications by Niezgoda and Roever (2001) and Schauer (2006) used videotaped scenarios in which the last utterance contained a pragmatic error, a grammatical error, or no error. Learners were asked to judge the severity of the error, and the goal of the study was to establish differential awareness of pragmatic and grammatical norms depending on language learning setting. Some aspects of this study could well be used for more formal assessment purposes: learners' ability to detect that something is pragmatically "off" about an utterance is an important part of metapragmatic awareness that has not been part of the proficiency tests discussed above, and the instrument could be extended to include a productive component where test takers correct or improve the perceived error. This, however, poses a problem of item dependence: if the same items are used for error detection and correction tasks, a correct response on the detection task is a precondition for a correct response on the correction task. Simply put, if a learner does not detect the error, they cannot correct it, and will lose two points. An example of a metapragmatic judgment item is shown in Figure 4.

A completely different approach combining extended discourse and assessment of comprehension was taken by Cook (2001). Instead of concentrating on a specific speech act,

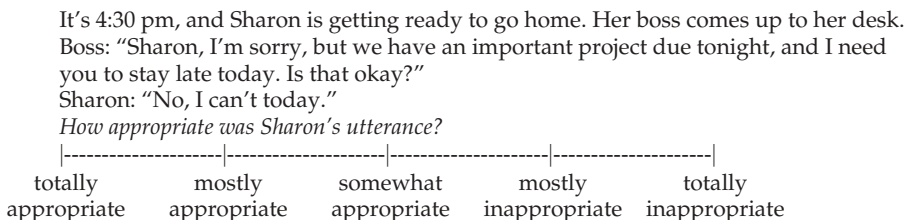

Figure 4 Metapragmatic judgment item

she worked in an interactional sociolinguistic framework and assessed test takers' comprehension of Japanese as a foreign language (JFL) contextualization cues in extended monologic discourse. As part of a midterm exam, she had 120 second-year JFL students at the University of Hawai'i listen to three recordings from simulated self-introductions by job applicants for a position as a bilingual (English/Japanese) store clerk in a retail shop in Honolulu. This is a realistic situation in Hawai'i where many stores rely on revenue from Japanese tourists and require their staff to speak some Japanese. Test takers were also given a copy of the (simulated) job advertisement and then asked to decide which of the three job applicants was most suited for the position. Two applicants met most of the criteria, and their Japanese was adequate in terms of sociolinguistic features for a job interview setting. One applicant, however, seemed to be a slightly better match to the criteria but used a highly inappropriate speech style, characterized by casualness, self-exaltation, underuse of honorifics, and overuse of emphatic markers. All this is strongly contrary to Japanese conventions, and Cook as well as a group of native and non-native JFL instructors felt that this applicant's blatant inappropriateness would immediately disqualify her. To Cook's surprise and dismay, over 80% of the test takers chose the inappropriate applicant as best suited for the position, citing her enthusiasm, self-assuredness and her own claim that she speaks Japanese well. Cook's test is interesting in its coverage of a different aspect of the construct of pragmatic ability, namely contextualization cues signaling speakers' understanding of the sociopragmatic norms of a given speech situation. While it also concerns sociopragmatic appropriateness, it assesses learners' sociopragmatic judgment of extended discourse, which contains a variety of cues, rather than of an isolated individual speech act. Cook's instrument is, however, essentially a one-item test, and would need to be extended to be used in any larger-scale assessment setting.

Challenges in Testing L2 Pragmatics

Fundamentally, tests of L2 pragmatics have the same requirements and pose the same development challenges as other language tests. They must be standardized to allow comparisons between test takers, they must be reliable to ensure precise measurement, they must be practical so that they do not overtax resources, and above all, they must allow defensible inferences to be drawn from scores that can inform real-world decisions (Messick, 1989).

From a test design perspective, it is also important to know what makes items difficult so they can be targeted at test takers at different ability levels. Findings on this aspect are limited by the small number of existing proficiency tests, but Roever (2004) shows some tendencies, such as formulaic implicature being more difficult than idiosyncratic, high-imposition speech acts being more difficult than low-imposition ones, and low-frequency routine formulae being more difficult than high-imposition ones.

The biggest challenge for pragmatics tests, however, is to extend their construct coverage. As Roever (2010) argues, the focus on atomized speech acts ignores essential features of language use in a social context, like contextualization cues, talk management devices, and Mey's (2001) "pragmatic acts." This means that testing of pragmatics should become more discursive and interactive but a significant challenge is to ensure standardization in discourse settings: How can task demands be kept the same for different test takers under interactive conditions, where context is dynamic and endogenous to interaction (Heritage, 1984; Kasper, 2006)? Additionally, interaction is a co-constructed endeavor, so how can the contribution of the interlocutor be subtracted from the entire conversation to only rate the test taker's contribution? Hudson et al. (1995) avoided this issue in their role plays by eliciting focal speech acts and only rating test taker performance on them but eventually tests of L2 pragmatics will have to seriously tackle interactive language use.

A second challenge that impacts tests using sociopragmatic judgment is establishing a baseline. Put simply, testers need a reliable way to determine correct and incorrect test taker responses. The usual way to do so is to use a native-speaker standard and this has been shown to work well for binary judgments of correct/incorrect, appropriate/inappropriate, and so on. For example, Bardovi-Harlig and Dörnyei (1998) and Schauer (2006) found high agreement among native speakers for the judgment of pragmatic performance as being correct/incorrect, and so did Roever (2005, 2006) for implicature interpretation and situational routines.

However, native-speaker benchmarking is much more problematic when it comes to preference judgments. For example, in Matsumura's (2001) benchmarking of his multiple-choice items on the appropriateness of advice, there was not a single item where 70% of a native-speaker benchmarking group ($N = 71$) agreed on the correct response, and only 2 items (out of a pre- and posttest total of 24) where more than 60% of native speakers agreed. On 10 items, the most popular response option was chosen by less than half the native-speaker group.

Such a lack of a clear correct response may be acceptable in a survey instrument that elicits preference but would be a serious flaw in a dichotomously scored assessment instrument where one answer must be clearly correct and the others clearly wrong. It might be an interesting approach to use partial credit scoring where scores are assigned based on the proportion of native speakers that chose a particular response option, but this has not yet been done in pragmatics assessment.

Liu (2006) faced a similar problem in the development of his test. Based on responses to a DCT from native and non-native speakers, he created a pilot version with four to eight response options per item, which he gave to two small groups of NS ($N = 7$ for apology items and $N = 6$ for request items). For every item, he retained the three options with the greatest native-speaker agreement as to their correctness/incorrectness, of which one was the key and the other two were distractors. He then created a 24-item DCT, which he gave to 5 native speakers. They showed perfect agreement on the key for 12 situations, 80% agreement on 7 further situations, and less agreement on the remaining 5 situations. Liu revised the 5 situations with the least agreement, and gave them to another group of 3 native speakers, who all chose the same key. Liu shows how to develop multiple-choice DCT items with clearly correct/incorrect response options but it is notable that he used very small native-speaker groups, and accepted 70% agreement. Native-speaker benchmarking remains a thorny issue for multiple-choice tests of L2 pragmatics.

Finally, tests of pragmatics have often been designed contrastively for a pair of languages, for example, native-Japanese speakers learning English (Hudson et al., 1995), native-English speakers learning Japanese (Yamashita, 1996), native-English speakers learning Korean (Ahn, 2005), or native-Chinese speakers learning English (Liu, 2006). This necessarily lowers the practicality of tests, as well as the likelihood that they will eventually become part of large-scale international test batteries (like TOEFL or IELTS). Roever (2005) did not limit his test taker population to a specific L1, and used differential item functioning to show that there were some L1 effects but that they were generally minor (Roever, 2007), indicating that limiting pragmatics tests to a specific population is not a necessity.

Conclusion

Tests of L2 pragmatics have seen a great deal of development and focused research in the last two decades. They offer a promising addition to the traditional language tests, which tend to focus on grammar, vocabulary, and skills. However, they pose significant challenges for test design if a complex construct like pragmatics is to be assessed comprehensively and reliably. Research in testing L2 pragmatics is clearly still in its early stages.

Assessment of Business and Professional Language for Specific Purposes

JANE LOCKWOOD

Introduction

The use of English in international worksites and across business and professions has grown rapidly since the 1980s. Multinational companies doing business worldwide need to communicate and negotiate with each other; global professionals need to build knowledge together across linguistic and cultural boundaries; governments and NGOs need to keep the peace and help build developing countries; and immigrants with professional and occupational aspirations and qualifications need to find work in their new homelands. These situations predominantly use English as their lingua franca (Graddol, 2006). English-language competency has become a global core skill and a highly valued commodity in today's world of work. Therefore developing and measuring business and professional language competence is understandably in high demand.

This entry will attempt to provide an overview of the key issues in English-language assessment for the specific purposes of business and the professions both now and in the future. The entry starts by describing what sorts of assessments are currently in the marketplace for business and professional English testing and evaluates their strengths and weaknesses. It then goes on to examine some current trends in English for specific purposes (ESP) curriculum pedagogy and finally discusses how this thinking may affect language-assessment practices in the future.

Recent Approaches to Language for Specific Purposes (LSP) Assessment in Business and Professional Contexts

Since the 1980s, and in response primarily to the business and professional needs of prospective employees from non-English-speaking backgrounds, LSP tests have proliferated. The purpose of these tests have, in the main, been to provide governments, educational providers, professional associations, and workplaces with valid, reliable, and practical tools to screen for the language suitability of the LSP test taker for, among other things, employment, promotion, citizenship, and university entrance. They have been developed to provide a one-point-in-time "gatekeeping" benchmarked screening test. These high-stakes screening LSP assessments fall into two broad categories.

First there are the large-scale "specific" language assessments developed by large testing organizations such as Cambridge ESOL, Educational Testing Services (ETS), and Pearson Education. In turn, these assessments fall into two main specialisms: English for tertiary studies and English for business. Over the years, such tests as the International English Language Testing System (IELTS; Cambridge ESOL) have developed a pre-tertiary test of English for non-English-speaking-background (NESB) high-school leavers wanting to gain entrance into English-speaking universities. The Test of English as a Foreign Language

2 ASSESSMENT OF BUSINESS AND PROFESSIONAL LANGUAGE

(TOEFL; ETS) and the Pearson Test of English Academic (PTE Academic) have been developed for this same large pre-university international market.

For the business market, these same large testing organizations, with the exception of Pearson, have developed the Business Language Testing Service (BULATS), the Business English Certificate 1–3 (BEC)—both offered by Cambridge ESOL—and the Test of English for International Communication (TOEIC)—offered by ETS—to name only a few. All these tests, however, face significant development challenges to ensure they maximize their market share of candidates who may have many different reasons for sitting them. For example, the test takers of the business tests are not necessarily interested in using their language-test result to work in a Western English-speaking country or even in a Western English-speaking company. For example, a university business graduate from Korea may want a TOEIC result to do business in Asia where the lingua franca is English. He or she may be communicating most of the time to non-native speakers of English. Because of the need for these business-testing organizations to maximize their market share, they have to ensure that they are not promoting specific business or ethnic cultures, nor specific language varieties and accents within their rubrics and test tasks. For example, asking a Japanese woman in a speaking assessment to recount a time when she lost her temper in a work situation is linguistically and culturally inappropriate, as may be role-play topics that too readily assume aligned views on such things as work–life balances, good parenting, the status of women as managers, and the responsibilities of the wealthy. In one well-known business-English test being administered in Hong Kong, the test task was seriously compromised because the notion of a “conference center” in the UK sense of the term was not readily understood in the Hong Kong context. These large assessment agencies are constantly modifying their tests and to some extent “neutralizing” the task content so that it does not favor or disadvantage any particular LSP business-English test-taking group.

The major benefit of these business LSP tests is that they provide an instantly recognizable international benchmark for language-proficiency level with validity and reliability. This is evidenced by the large number of universities and workplaces that stipulate ETS (TOEFL or TOEIC) or Cambridge ESOL (BULATS) benchmark levels for entry. These tests are what could be termed “generic” LSP tests for business and the workplace.

The other category of more genuinely “specific” language assessments has generally been developed by universities, professional bodies, and private companies, mostly in English-speaking countries in the West, to meet the needs of specific professional groups. The word “genuinely” is used here because these tests have been developed often at the request of clients to test highly specific communication skills for employment. These tests therefore attempt to mirror the communication needs of very specific target-language-use (TLU) situations of a range of professional workers.

These professional entry tests differ from the first category discussed in this entry in two ways. First, they are used for smaller and homogeneous professional and occupational populations; and, second, they use specialized and contextualized knowledge and authentic data taken from an analysis of the TLU situation to inform the test task and rubric development.

A specific purpose language test is one in which test content and methods are derived from an analysis of a specific purpose target language use situation, so that the test tasks and content are authentically representative of tasks in the target situation, allowing for an interaction between the test taker’s language ability and specific purposes content knowledge on the one hand, and the test tasks on the other. Such a test allows us to make inferences about a test taker’s capacity to use language in the specific purpose domain. (Douglas 2000: 19)

It is noteworthy that many of these tests have been developed by countries such as the USA, Canada, and Australia—countries with very high immigrant populations seeking work. For example, doctors and nurses in Australia need to pass the Occupational English Test (OET) funded by the Australian government and endorsed by the Australian Medical Association (AMA) in order to become registered health professionals in Australia. McNamara (1990, 1997) has written extensively about the development, implementation, and evaluation of the OET. This test was developed as the result of exhaustive observations of the TLU situation and an analysis of authentic recordings of doctor–patient exchanges. Similarly, school teachers have to pass the Proficiency Test for Language Teachers (McDowell, 1995; Elder, 2001), also funded by the Australian government, to become classroom teachers in Australia. Airline pilots worldwide, as of 2008, need to sit a screening test from a range of English for aviation tests as mandated by the International Civil Aviation Organization (ICAO) to have a certificate attesting to their proficiency level in the language(s) used for aeronautical communication. Even peacekeepers are tested for English before they go on assignments overseas where the common language will be English. In the development of some of these tests, new and innovative linguistic frameworks have been used in linking the test task to the target-language context through using genre studies, discourse analysis, close TLU observations, and corpus studies to inform the test. In this kind of LSP assessment development the immediate language-test-use situation, analyses of the authentic data, and the veracity of the test tools and processes are paramount. However, is this enough? Are these the key requirements for LSP assessment?

Some Issues to Ponder

It is often the case, as reported by Douglas (2001) and Jacoby and McNamara (1999), that, despite passing the specialized test, the candidate still fails to communicate in an appropriate way on the job. What more can be done by the assessment designer to ensure that communication weaknesses are identified and the criteria revisited?

Perhaps there is a need to consider in much more detail the professional contexts, purposes, and stakeholder practices for which these tests are requested. However, to do this, LSP developers need access to the business and professional stakeholder concerns to explore how the requirements of their own (professional stakeholder) evaluation processes can be captured through language assessments. An emerging literature in ESP curriculum development, suggesting that ESP practitioners consider and understand more deeply the concerns of the workplace, is setting a research agenda also for those working in LSP assessment development. Let us first consider the current work in ESP curriculum development as a way into these concerns.

Since the 1980s there has been a proliferation of ESP courses ranging from English for health professionals to English for call-center agents, and the curriculum-development issues are well documented (Hutchinson and Waters, 1987; Johns & Dudley-Evans, 1993; Candlin & Candlin, 2003; Basturkman, 2006; Belcher, 2009; Bhatia, 2008; Bremner, 2008; Lockwood, 2010). Genre-based pedagogies (i.e., the way spoken and written texts are organized), discourse analysis (i.e., the way certain lexico-grammatical linguistic features are reflected and patterned in the text under investigation), and corpus linguistics (i.e., the frequency of occurrence of certain lexico-grammatical items found in the authentic data of the texts) have provided new and exciting linguistic frameworks to probe the specialization of language knowledge, skills, and awareness required in specific worksites and occupational-language texts. This current theory is informing new and innovative curriculum practices. Also, interdiscursivity approaches (i.e., the way texts in professional sites will build in certain ways on each other; Bhatia, 2008; Bremner, 2008) in the work of

ESP specialists are currently being suggested as a means for facilitating the understanding of learners' communication needs in ESP courses. These linguists talk about interdiscursivity and the importance of multiple perspectives for ESP curriculum design, calling for much more than a linguistic analysis of professional genres: "Professional genres have often been analysed in isolation, leaving the study of professional practice almost completely out, except as providing context for specific analyses, thus undermining the role of interdiscursivity in professional genres and practices" (Bhatia, 2008, p. 161). Bhatia defines this concern further when he says in a more recent article:

Other contributions to the construction of professional artefacts are conventions of the genre in question, the understanding of the professional practice in which the genre is embedded, and the culture of the profession, discipline, or institution, which constrains the use of textual resources for a particular discursive practice. In other words, any instance of professional communication simultaneously operates and can be analysed at the four levels, as text, as representation of genre, as realization of professional practice, and as expectation of professional culture. (Bhatia, 2010, p. 33)

An empirical exploration of the TLU contexts is being suggested in these approaches.

LSP assessment practices appear to have lagged behind the innovations in course development where communicative competency domains (Canale & Swain, 1980; Bachman & Palmer, 1996) have dominated LSP assessment practices across the four skills of listening, speaking, reading, and writing. Douglas (2001) challenges these criteria and has written more recently about what he terms "indigenous criteria" for LSP assessment:

I want to discuss the theoretical underpinnings of the development of LSP assessment criteria and argue that it is important for us to derive them not only from a theoretical understanding of communicative language ability (Bachman and Palmer, 1996) but also from an empirical analysis of the TLU situation. (Douglas, 2001, p. 174)

Douglas's concern was triggered by reports from subject specialists at his own university that students were judged on criteria other than communicative-competency domains when delivering their presentations, and he was interested to find out why this was the case. How deeply one should conduct an empirical analysis of the TLU situation is an interesting question and Douglas concludes:

There is a "strong" indigenous assessment hypothesis which would involve employing the criteria derived from an analysis of assessment practices directly in the TLU situation; however, I do not advocate such a strong case. Rather I wish to suggest a weaker indigenous assessment hypothesis in which the indigenous criteria may be used to supplement linguistically-oriented criteria in line with construct definition, and, secondly, to help guide our interpretations of language performances in specific purpose tests. (2006, p. 183)

This is indeed a challenge to the LSP assessment fraternity in selecting, validating, and calibrating new criteria.

Some Challenges Ahead

LSP assessment is an emerging research and development area and provides the testing community with challenges. These are discussed in this part of the entry. First, we must

ask the question about how we ensure that LSP assessment development is context sensitive and to what degree. How does the assessment meet the changing needs within the requirements of the industry, worksite, or educational institution? Are there arguments for using what Douglas (2001) has termed “weak” indigenous assessment criteria as opposed to “strong” criteria in certain contexts? If indigenous criteria for assessments become written into LSP assessments, how is this going to affect the validity and reliability of our assessments?

This then leads to the question of “ownership” of the LSP assessments. Who decides ultimately on the criteria? Coupled with this is the question about who carries out LSP assessments. Conventional practice in LSP testing is that the assessments themselves are carried out by applied-linguistic experts suitably trained as language assessors. However, workplaces are challenging this practice. Why can quality-assurance personnel in banks not assess communication skills? What are the issues in training such personnel to carry out LSP assessments?

Also, given that some workplaces are requiring LSP language assessment to be embedded in their own work practices (Lockwood, 2010), is there an LSP assessment process that might be developed to ensure that ongoing workplace LSP assessment happens in a systematic and thoroughgoing way that remains valid and reliable and embedded in the work flow of that worksite? This would necessitate close stakeholder involvement and ownership and a thorough understanding of the contextual requirements for assessment to be incorporated, end-to-end, into workplace practices.

Another significant challenge for LPS assessment relates to the fact that traditional paradigms for LSP assessment development are also being challenged by the growing acceptance that native-speaker norms are no longer relevant to many (if not most) target-language LSP assessment contexts, especially in international business contexts. So much of the LSP assessment work to date has assumed a native-speaker model. In a world where most of the business communication is conducted between NESB speakers (Graddol, 2006), how can this be relevant and fair? How can the concerns of business English as lingua franca (BELF) be reflected in LSP assessment tools and processes in the future (Nickerson, 2005)?

One final concern for LSP assessment developers is the situation where LSP assessments are used for contexts for which they were not designed. For example, the IELTS academic-paper exam is being used for high-stakes professional employment purposes and for university-graduation requirements in many countries. TOEIC scores for listening and reading are being used to recruit customer-services agents in the burgeoning business-processing outsourcing (BPO) industry in some parts of Asia. How can highly lucrative LSP assessment contracts be regulated for the validity and reliability of the tests they offer?

In conclusion, it would seem that some of the greatest challenges for LSP assessment lie ahead. Gaining access to LSP assessment worksites, listening to and learning about their needs, and keeping an open mind on who needs this assessment expertise and how it can be sensibly transferred and embedded in the workflow of the company are critical.

The need to offer valid, reliable, and practical tailor-made solutions will provide a busy agenda for LSP assessment in the future for businesses and professions.

Assessment of Reading

KEIKO KODA

Reading comprehension is a complex process, which has been conceptualized from diverse perspectives in first-language (L1) reading research. Reading in a second language (L2) entails even more complexity, but a definition of reading comprehension is needed if developers are to create tests that measure L2 learners' reading comprehension. This entry describes contrasting views of reading comprehension and their relation to reading assessment, and then explains differences between L1 and L2 reading and their relevance to L2 reading assessment.

Multiple Views of Comprehension

The ultimate goal of reading is to construct text meanings based on visually encoded linguistic information. As such, it entails three major operations: (a) *decoding* (extracting linguistic information from printed words), (b) *text-information building* (assembling locally constructed information into larger text units), and (c) *reader-model construction* (integrating background knowledge and assembled text meanings). Because each operation necessitates a unique set of subskills, learning to read occurs in sequential stages, in which new subskills are acquired on the basis of previously established competencies (Chall, 1983).

Over the past five decades, two contrasting views of comprehension have dominated L1 reading research: one seeing comprehension as a *product* of the reader's interaction with a text, and the other as the *process* of such interaction (Johnston, 1984). Reading assessment is grounded in the former view of reading. This view contends that the outcomes of reading are stored in memory, and therefore that comprehension can be estimated by persuading the reader to demonstrate portions of the stored text information. Two assumptions underlie these contentions: Comprehension occurs only if text information is stored in memory—and content retention is only possible when it is adequately understood. Obviously, these assumptions do not distinguish comprehension and memory, as evident in widely used product-oriented assessment tasks, including multiple-choice questions, constructed responses, and free recall. The blurred distinction between memory and comprehension has led to major controversy, however, because any portion of performance variances could be explained by memory alone without comprehension. Another objection is that this view gives little attention to the process through which stored text segments are formed and retained. In the absence of such critical information, assessment results reveal little about sources of reading problems, and therefore preclude any diagnostic test outcomes.

The process view, in contrast, posits that comprehension and memory are separable. It maintains that what is comprehended must be distinguished from what is already stored in memory, and therefore that evolving text understanding should be measured in real time before it is sent to long-term memory. The view underscores the importance of working memory as the space where segmental information is integrated into larger text units. From this view, assessment tasks are designed to capture ongoing operations as they occur in working memory. Online procedures, such as lexical judgment and

2 ASSESSMENT OF READING

eye-movement tracking, serve as examples. Although these and other process-based tasks yield significant information on the very process of text meaning construction, caution must be exercised in using these tasks. Because many of these tasks demand concurrent engagement in multiple operations, they can cause serious disruption to normal reading processes during comprehension.

However reading is defined, there is a uniform agreement that comprehension is not an all-or-nothing pursuit, but a matter of degree, and therefore distinguishing degrees of text comprehension is vital in assessing reading ability and understanding reading development. However, capturing those differences is methodologically challenging. Because reading cannot be directly observed, comparisons of comprehension necessitate behavioral indicators that stand for distinct levels of text understanding. It is vital to clarify what “comprehending better” means and how “better comprehension” can be indexed through observable reader behaviors.

One way of achieving these clarifications is to use “processing demands” as the basis for differentiating degrees of comprehension. The demands-based approach is advantageous because “processing demands” can be distinguished by identifying the cognitive and linguistic requisites for each assessment task. To illustrate, varying types of comprehension questions demand different levels of text information probing. For example, questions asking about text-explicit information can be answered simply by locating a word or a phrase, whereas those dealing with text-implicit information require deeper levels of understanding because they entail conceptual maneuvers, such as inferring underlying assumptions and evaluating argument plausibility. Thus this approach makes it possible to calibrate correspondence between processing demands and comprehension through systematic comparisons of performances on tasks imposing varying processing demands, and in so doing offers a systematic method of classifying observed behaviors into a set of indicators presumed to correspond to comprehension differences.

Assessment Purposes

Reading assessment entails systematic samplings of reading behaviors which are then scored and those scores are used to make judgments about an examinee’s reading ability (Johnston, 1984). The uses of the assessment outcomes should affect what constitutes the behaviors sampled on the test to distinguish among levels of “reading ability.” It is critical to clarify how the assessment purposes and intended uses should guide and constrain assessment design and interpretation. Three commonplace assessment uses—administration, diagnosis, and classification—are illustrative.

Administrative decisions include funding allocation and policy implementation. Assessment outcomes must yield information that facilitates the evaluation of a particular educational program, often by comparison to others, or that of educational achievements among learner groups on the basis of factors such as race, gender, and socioeconomic status. The assessment for this use must include learners with a full spectrum of reading abilities, as well as tasks eliciting a broad range of the behaviors constituting the normal act of reading. Thus, by design, administrative assessment informs little about individual readers or disparate subskills.

Diagnostic assessment is used to identify possible sources of reading difficulties. Diagnostic assessment must be sensitive to differences in qualitative and quantitative changes in reading subskills development both within and across individual learners so as to capture the dynamic nature of reading development. So long as the subskills to be measured are clearly specified within well-refined reading models, the assessment can be criterion-referenced, focusing only on the skills considered to be a potential factor

causing comprehension difficulty. Outcomes from such tightly regimented tasks can guide instructional decision making, particularly with respect to programs aimed at overcoming specific reading problems.

Classification decisions are made by collecting information that provides a legitimate basis for comparisons among individuals. The assessment outcomes provide one piece of evidence for such decisions as college admissions, employment qualifications, placement, and course grades. Because the purpose of the assessment is to determine individual learners' reading ability relative to others, reading subskills must be compared on a common yardstick. Such assessments have to be developed using a limited set of tasks and thus cannot identify the specific subskills that differentiate individuals. Instead, outcomes typically consist of a single score for reading ability.

L2 Reading Development

Although the primary objectives do not vary whether reading is assessed in the primary language or an additional language, L1 and L2 reading differ in several ways that are important for assessment. For example, L2 reading encompasses a broad range of learners, including those of different ages and with diverse linguistic backgrounds. In this context, "L2 readers" refers to those who learn to read in a second language after becoming literate in their first languages. For them, learning to read in their L2 evolves through complex crosslinguistic interaction between previously acquired L1 skills and emerging L2 linguistic knowledge (Wang, Koda, & Perfetti, 2003; Hamada & Koda, 2008). L2 reading thus involves two languages and is inherently more complex than monolingual L1 reading. Empirical examinations of L2 reading should incorporate both L1 and L2 factors in explaining and predicting individual differences in its development. Three factors are centrally related to the variances unique to L2 reading: (a) transferred L1 skills, (b) L1–L2 linguistic distance, and (c) underdeveloped L2 knowledge.

Transferred reading skills are a critical source of the unique variances in L2 reading development. Closely attuned to L1 linguistic properties, those skills cope variably with the demands imposed by L2-specific properties (Koda, 2005). Experimental studies have repeatedly shown that L2 learners respond differently to a variety of experimental manipulations (e.g., Brown & Haynes, 1985; Green & Meara, 1987; Koda, 1998, 1999; Akamatsu, 2003); and that those variations are directly associated with the properties of the participants' respective L1s (e.g., Koda, 1989, 1990, 1993; Ryan & Meara, 1991). Spelling regularity, for example, is known to promote decoding performance somewhat uniformly in L1 readers. In L2 reading, however, regularly spelled words induce systematic, but diverse, reactions among learners with diverse L1 backgrounds (e.g., Hamada & Koda, 2008; Wang & Koda, 2005). L2 reading development thus is seriously affected by previously acquired reading skills.

L1 and L2 linguistic distance is another factor contributing to variations in L2 reading development (Muljani, Koda, & Moates, 1998; Koda, 2007; Hamada & Koda, 2010). Linguistic distance refers to the degree of structural similarity between two languages, which directly affects the degree of similarity in the processing demands of each language. When L1 and L2 are closely related, transferred skills can be used with little adjustment. Conversely, when the two are typologically distinct, L1 skills must undergo substantial modification so as to achieve sufficient functionality in the new language. Although crosslinguistic transfer occurs between any two languages, facilitation benefits brought about through transferred skills vary across linguistically diverse learner groups. Hence, linguistic distance is causally related to differences in L2 processing efficiency, and thus constitutes an additional source of the variances uniquely found in L2 reading.

Underdeveloped linguistic knowledge also generates L2-specific variations in reading subskills development. Typically, in the L2, learning to read commences before sufficient linguistic knowledge is acquired. Although L2 learners have well-established reading skills and other cognitive resources, insufficient L2 knowledge can block their access to the previously acquired competencies. As Clarke (1980) put it, “limited control over the language ‘short circuits’ the good reader’s system causing him/her to revert to poor reader strategies when confronted with a difficult or confusing task in the second language” (p. 206). It is hard to determine, however, what constitutes “limited” linguistic knowledge because a number of other factors also explain comprehension failure, and isolating them is methodologically infeasible. Stipulating how much knowledge is necessary for L2 reading acquisition is also problematic because it varies according to linguistic distance between the languages involved. Here again, these disparities unique to L2 reading development demand additional caution in its assessment.

Unique Challenges in L2 Reading Assessment

Given that successful comprehension necessitates a solid linguistic foundation, particularly in a second language, it is not surprising that L2 reading instruction places heavy weight on language elements, rather than on reading skills. The linguistic orientation is clearly shown in widely used instructional activities, such as translation, text glossing, and grammar explanations. Several assumptions lie behind these tactics: (a) reading skills are similar across languages; (b) those skills, once developed in one language, are similarly functional in another language; and (c) L2 linguistic knowledge provides ready access to previously acquired reading skills. Obviously, these assumptions do not take into account crosslinguistic differences in reading subskills and their long-lasting impacts on L2 reading development.

The linguistic prominence is also evident in L2 reading assessment. As in instruction, it focuses more on linguistic sophistication than on reading skills. Seen as an integral aspect of L2 proficiency, L2 reading ability is used as the basis for gauging L2 linguistic knowledge. Linguistic features in texts, such as syntactic complexity and vocabulary density, are therefore treated as the key predictors of comprehension difficulty and are altered by test developers to manipulate processing demands for inducing desired variance in test scores. Thus in this case, the primary assessment goal is to estimate the examinees’ L2 linguistic sophistication, through reading ability, based on observable reading behaviors. As such, L2 reading assessment entails two layers of deductions—first, gauging reading ability based on the reading behaviors elicited, and then inferring L2 linguistic sophistication from the estimated reading ability. For assessment results to be reasonably accurate, therefore, manipulated linguistic elements must be unambiguously linked to the intended variances through the manipulation. In practice, however, it is difficult to establish such clear-cut linkages between intended and observed variances. Several factors obscure their relationship, and make outcome interpretation difficult.

One such factor is language selection—that is, decisions regarding the use of either L1 or L2 for nonpassage elements (e.g., test administration and comprehension questions). When the L2 is used for task instructions, for example, there is always a likelihood that some learners pursue the task without understanding what they are being asked to do. Although a clear grasp of the task, when presented in the target language, can be taken as partial evidence of linguistic sophistication, comprehension variances derived from nonpassage elements are unintended and likely to be random. When poor performance occurs, it is less than certain whether comprehension difficulty is attributable to task misconceptions, underdeveloped L2 knowledge, or inadequate reading skills. Conflation of this sort, arising from nonpassage obstacles, is a major threat to accurate interpretation of scores.

Lexical scaffolding, such as glossary and dictionary, also affects the interpretability of assessment outcomes. Because the relationship between vocabulary size and conceptual knowledge varies in L1 and L2 reading, lexical scaffolding has different effects on comprehension performance in L1 and L2 assessment. Although the two are closely related in L1 reading (e.g., Anderson & Nagy, 1991), parallel closeness in their relationship cannot be assumed in L2 learners because their conceptual knowledge generally is far more established than their still evolving L2 vocabulary knowledge. If the assessment objective is to gauge reading competence, as in the case of L1 reading, lexical scaffolding provides ready access to stored conceptual information, and thus reduces the risk of underestimating the intended ability to construct text meanings when dealing with conceptually familiar, but linguistically unfamiliar, passages. If, however, the primary goal is to estimate the examinees' linguistic sophistication, as in the case of L2 assessment, lexical assistance may hamper accurate inference about L2 linguistic sophistication presumed to underlie task performance.

Text modification is yet another factor directly influencing the legitimacy of the two-layered inferences in L2 reading assessment. A text's linguistic features are often modified to reduce task demands by, for example, rephrasing syntactically complex sentences, or by using more explicit co-referential forms. Although such linguistic simplification is commonly incorporated in L2 reading instruction and assessment, it is not clear whether modified features are similarly simpler, and thus easier to process, among linguistically heterogeneous L2 learners. Given that transferred skills are in tune with L1, rather than L2, properties, any change in L2 linguistic features could alter processing demands in disparate manners and to varying extents across diverse learner groups. Failure to induce the intended effect is likely to yield random, and thus uninterpretable, results.

Assessment, Research, and Instruction

Reading research and assessment are symbiotic because the two are functionally interdependent. Research, for example, demands valid and reliable information on individuals' reading ability derived from assessment, while assessment depends on research to construe the very construct of reading ability. The mutual dependency is also evident in their objectives. While assessment aims at differentiating individuals on the basis of reading ability, research seeks principled ways to explain those differences. In order to benefit from the reciprocity, assessment specialists must keep pace with continually evolving models of reading, and reading researchers must stay informed about the specific task demands—both linguistic and cognitive—in diverse assessment procedures. Additionally, L2 assessment must allow for the issues specifically related to L2 reading—L1-induced variations, for example—based on empirical findings in L2 research. Accurate outcome interpretation can only result from sustained symbiosis between L2 reading research and assessment.

Ideally, reading assessment and instruction should be mutually enhancing in such a way that assessment shapes instructional approaches, and instruction guides assessment design. Such cyclical enhancement rarely occurs, however, when L2 assessment relies solely on standardized reading tasks. Standardized assessment tasks measure externally determined facets of reading ability without regard for specific instruction-internal goals and approaches. To improve reading test performance through instruction, therefore, a curriculum must be configured for enhancing test scores, rather than for engaging in the variety of activities needed to increase a range of reading abilities. Standardized reading assessment by design indicates individual learners' relative standing using their peer group rather than providing information regarding specific impediments of individual learners that would suggest instructional interventions necessary for alleviating those impediments.

For reading assessment to provide positive washback on L2 instruction, assessment outcomes must be interpretable in relation to the particular reading skill presumed to underlie task performance and the linguistic knowledge necessary for its utilization. If the task requirements are not carefully identified within a sound model of reading, neither assessment nor instruction can propagate long-term gains in L2 proficiency. This is particularly true when instruction involves linguistically divergent learners whose L2 skills build on the distinct linguistic bases formed through L1 reading experience. Assessment results shape instruction most forcefully when they pinpoint the specific needs of individual learners.

Future Directions in L2 Reading Assessment

L2 reading assessment has taken shape following the principles in L1 reading assessment. However, those principles are only partially applicable, because their concerns are fundamentally monolingual. Predictably, current L2 assessment does not adequately address crosslinguistic and other L2-specific issues that are not well articulated in L1 reading assessment. Future agendas can be purposefully built to tackle these additional complexities specifically related to the unique nature of L2 reading and the challenges it imposes.

One way of expanding L2 reading assessment is to incorporate explicitly L1-induced variations in models of reading performance. Although research has shown that previously acquired skills variably facilitate L2 reading development, we know little about how such variations affect the interpretability of assessment outcomes. For example, it is well recognized that decoding competence develops at disparate rates among L2 learners with orthographically similar and dissimilar L1 backgrounds, but it is less known how such disparity predicts L2 text comprehension. We have yet to know to what extent L1-induced facilitation in one operation enhances the execution of other, later occurring, operations. These complex issues have begun to attract serious attention among L2 reading researchers. Findings from this research, if properly incorporated in L2 reading assessment, could substantially enhance the accuracy of its outcome interpretation, and increase understanding of score comparability of readings tests claimed to have equivalent score meaning across languages.

Another way of extending L2 reading assessment is to explore methods of distinguishing two key constructs—linguistic knowledge and reading ability. Because these constructs are both multifaceted, isolating them requires at the minimum clear specification of the reading subskill to be measured and the linguistic knowledge necessitated for its execution. Such clarification can be achieved through a sequence of analyses, including (a) construct analysis (isolating the reading subskill required for performing on a particular assessment task), (b) linguistic analysis (identifying the linguistic facet directly related to the skill under consideration), and (c) crosslinguistic analysis (determining how the linguistic demands vary between two languages). By isolating the two constructs, these analyses make it possible to establish the link between the two constructs based on one set of observable behaviors, and in so doing, to make outcome interpretation meaningful. If L2 reading performance can be predicted on the basis of specific facets of linguistic knowledge, assessment outcomes can be of direct utility to L2 instruction.

Although reading involves both linguistic and conceptual operations, far less attention has been given to conceptual skills in L2 reading assessment. Because the current practice focuses on linguistic knowledge as the primary source of reading difficulty, it mandates little provision for distinguishing reading ability and linguistic knowledge. As a result, L2 reading assessment tends to center on comprehension of conceptually neutral texts

that requires meaning construction of familiar content. However, linguistic processing constitutes only a partial requisite for assimilating new ideas in conceptually unfamiliar texts. A large number of learners—both adults and children—strive to read in a second, or a later acquired, language. Despite its significance, the *reading to learn* capacity is rarely incorporated in L2 reading assessment. It would be useful to explore ways of measuring more conceptual manipulation skills necessary for learning from unfamiliar texts.

Assessment of Speaking

APRIL GINTHER

Speaking is seen by language testers as the most difficult of the four language skills to assess. Assessing speaking requires that we either observe a “live” oral performance or that we capture the performance by some means for evaluation at a later time. A method for elicitation must be selected, rating scales must be developed, and interviewers and/or raters must be trained. Therefore, understanding the assessment of speaking requires examination of assessment methods, scales, and raters.

Speaking Assessment Methods

Although in a sense, all language tests are an indirect measure of the ability they measure, Clark’s (1979) classification of language assessment methods as indirect, semidirect, and direct has proven useful for understanding speaking assessment methods. Indirect tests evaluate the skills and abilities that underlie an examinee’s performance by eliciting performance on item types such as a multiple-choice main idea item to measure reading comprehension. However, indirect methods do not lend themselves well, if at all, to the assessment of speaking.

Direct tests evaluate speaking skills and abilities in actual performance. The classic example of a direct assessment of speaking is an interview in which participants engage in structured or semistructured interaction with an interlocutor/interviewer/rater. Speaking assessment methods centered on interviews are collectively referred to as OPIs or oral proficiency interviews. A very well-known OPI is the American Council of Teachers of Foreign Languages Oral Proficiency Interview or the ACTFL OPI (ACTFL, 2009), and many locally developed OPIs are modifications of the proficiency guidelines and elicitation procedures associated with the ACTFL OPI. Common OPI structures involve a series of warm-up questions followed by a subsequent series of increasingly difficult questions where examinees are expected to display concomitantly increasing levels of complexity in their responses. Interviewers may be required to elicit a preselected set of responses, or may decide to follow up on topics or comments that the participant has introduced, or both. Examinee performance may be rated simultaneously by the interviewer or by additional raters who rate as the interview proceeds. When an audio or video recording is made, responses can be rated after the interview is completed. A variation of the direct method may require the examinee to give a presentation on a selected topic, and presentations often include or require face-to-face engagement with members of an audience who pose follow-up questions.

Direct methods are defined as “procedures in which the examinee is asked to engage in face-to-face communicative exchanges with one or more human interlocutors” (Clark, 1979, p. 36). Direct tests have the perceived advantage of their elicitation of speaking skills in a manner which duplicates “the setting and operation of the real-life situations in which proficiency is normally demonstrated” (Shohamy, 1994, p. 100); that is, direct assessments of speaking abilities have considerable face validity. However, an important but often overlooked caveat is one that Clark (1979) identified early on: “In the interview situation, the examinee is certainly aware that he or she is talking to a language assessor and not a

2 ASSESSMENT OF SPEAKING

waiter, taxi driver, or personal friend" (p. 38). Indeed, the idea of the fidelity of OPIs to natural conversation has been challenged by a number of researchers (Ross & Berwick, 1992; Johnson & Tyler, 1998), leading others to qualify OPIs as a specific genre of face-to-face interaction (He & Young, 1998). Nevertheless, research on actual interaction in such tests indicates the OPI genre does share important characteristics with natural conversation (Lazaraton, 1992, 1997).

While OPIs have traditionally been administered with a single interviewer and a single interviewee, speaking assessment of examinees in pairs, or even groups, has become the object of a growing amount of attention from both researchers and language assessment practitioners (Brooks, 2009; Ducasse & Brown, 2009). The procedure is often referred to as "paired orals" or "group orals." Such formats are argued to hold potential for increased interactivity and authenticity relative to a one-on-one interview; however, the added complexity complicates rating. Nevertheless, paired and group oral assessments have successfully been incorporated into large-scale assessment programs (Hasselgreen, 2005; Van Moere, 2006).

Some large-scale testing programs find any type of direct testing of speaking unworkable, and therefore choose semidirect methods, which do not require the presence of an interlocutor to administer the test. Examinees are presented with a set of prerecorded questions or tasks typically under laboratory conditions, and responses are recorded for subsequent rating. The most obvious advantages of semidirect methods are their potential for efficiency, time and cost savings, and high reliability. The absence of a human interlocutor decreases costs associated with administration which can be considerable when assessments must be conducted and scores reported in tight time frames. Potential savings, however, may only be realized in the long run. The development and maintenance of a semidirect computer-based system requires considerable technical expertise. A more important advantage of the use of semidirect methods is the potential reduction of construct-irrelevant variance associated with interviewer effects. Because speaking performances may be influenced variably and in unintended ways by the interviewer's technique and demeanor, the use of semidirect methods may even the playing field for all examinees.

Researchers comparing direct and semidirect OPI testing methods have reported strong, positive correlations (.89 to .95) leading Stansfield (1991) and Stansfield and Kenyon (1992) to argue that the methods are largely equivalent, statistically speaking. However, qualitative analyses of the language have revealed differences in the language produced. Semidirect responses tend to display greater formality and more cohesion while being accompanied by longer pauses and hesitations (Shohamy, 1994; Koike, 1998). Research investigating examinees' affect and perceptions (Brown, 1993; Qian, 2009) has found that examinees tend to prefer direct methods, reporting that they find interaction with a recorder or computer forced and unnatural. This preference may abate as examinees become more familiar with the large-scale semidirect methods introduced in 2005 in the TOEFL iBT speaking subsection and as the use of software to develop local, semidirect computer-based programs increases. In any case, appropriate examinee preparation is important when any semidirect method is employed. Ultimately, Shohamy (1994) concludes that the selection of a direct or semidirect method is dependent on four related concerns: accuracy (a function of reliability), utility (the assessment's relation to instruction and the difficulties associated with rater training), feasibility (ease and cost of administration), and fairness.

Rating Scales and Scale Descriptors

Assessment of speaking requires assigning numbers to the characteristics of the speech sample in a systematic fashion through the use of a scale. A scale represents the range of

values that is associated with particular levels of performance, and scaling rules represent the relationship between the characteristic of interest and the value assigned (Crocker & Algina, 1986). The use of a scale for measurement is more intuitively clear in familiar domains apart from language ability. For example, we can measure weight very accurately. While the use of pounds or kilograms is usually sufficient for measuring the weight of adults, when measuring babies, we move to smaller and more precise units—ounces or grams. The characteristics of the objects measured and our need for accuracy determine the units of measurement selected, and, in turn, scaling rules describe the units of measurement we employ.

Measurement of a speaking performance, however, requires a different kind of scale, such as those used in rating performance in sports competitions. For example, the quality of a figure skater's performance in the Olympics is based on rank; there is no equal-interval unit of measurement comparable to ounces or pounds that allows precise measurement of a figure skating performance. Likewise, assessing speaking is generally considered an endeavor that ranks students into ordinal categories (often referred to as vertical categories) similar to bronze, silver, or gold; short, medium, and tall; third, second, or first—more familiar in instructional contexts involving language as beginning, intermediate, and advanced.

Such a global assessment of performance would result from the use of a holistic scale. To clarify what such a global assessment means, the abilities associated with scale levels are represented by level descriptors which represent a qualitative summary of the raters' observations. In order to facilitate description, benchmark performances are selected to exemplify the levels and their descriptors. Such descriptors are typically associated with, but are not limited to, descriptions of the following components of a speaking performance at different levels of the scale: pronunciation (focusing on segmentals); phonological control (focusing on suprasegmentals); grammar/accuracy (morphology, syntax, and usage); fluency (speed and pausing); vocabulary (range and idiomaticity); coherence; and organization. If the assessment involves evaluation of interaction, the following may also be included: turn-taking strategies, cooperative strategies, and asking for or providing clarification when needed.

Holistic vertical indicators, even when accompanied by scale descriptors and benchmarks, may not be sufficient for making instructional or placement decisions. In such cases, an analytic rating is done to produce scores on components of the examinee's performance. The specific components chosen, which can include any of the same aspects of performance used in holistic scale descriptors, will depend on the purpose of the test and the needs of the score users.

Score users are of central concern in Alderson's (1991) distinction among three types of scales: user-oriented, assessor-oriented, and constructor-oriented. The language used to describe abilities tends to focus on the positive aspects of performance in user-oriented and constructor-oriented scales where the former may focus on likely behaviors at a given level and the latter may focus on particular tasks that may be associated with a curriculum or course of instruction. Assessor-oriented scales shift the focus from the learner and the objectives of learning toward the rater; the scale descriptors are often negatively worded and focus on the perceptions of the rater. These scales tend to be more useful for screening purposes.

From another perspective, scales for speaking assessments can be theoretically oriented, empirically oriented, or a combination of both. The starting point for all assessments is usually a description or theory of language ability (e.g., Canale & Swain, 1980; Bachman, 1990). These broad theoretical orientations are then narrowed down to focus on a particular skill and particular components of skills. Empirical approaches to the development and validation of speaking assessment scales involve identification of characteristics of interest

for the subsequent development of scale levels (e.g., Chalhoub-Deville, 1995; Fulcher, 1996) and/or explications of characteristics of assigned ability levels (e.g., Xi & Mollaun, 2006; Iwashita, Brown, McNamara, & O'Hagan, 2008; Ginther, Dimova, & Yang, 2010).

Specific-purpose scales are often derived from general guidelines and frameworks. For example, The ACTFL Proficiency Guidelines (2009) serve as a starting point for the ACTFL OPI scale. Another influential framework is the Common European Framework of Reference for Languages (Council of Europe, 2001). The CEFR is a collection of descriptions of language ability, ranging from beginning to advanced, across and within the four main skills. The document is comprehensive and formidable in scope, but in spite of its breadth, the CEFR has been used to construct scales for assessing language performance, communicate about levels locally and nationally (Figueras & Noijons, 2009), and interpret test scores (Tannenbaum & Wylie, 2008).

The most familiar part of the framework presents six stages of proficiency from A1 (Breakthrough) to C2 (Mastery) in general terms. Descriptors are provided in a series of tables for each skill and then each skill is additionally broken down into subskill descriptions that can be adapted for use in the creation of scales for specific purposes within specific contexts. For example, with respect to speaking, the framework presents separate tables for overall oral production standards, for understanding a native speaking interlocutor, for conversation, for informal discussion with friends, for formal discussions and meetings, for goal-oriented cooperation, for transactions to obtain goods and services, for information exchange, and for interviewing and being interviewed. Perhaps of greatest interest here are the "qualitative aspects of spoken language use" in which spoken abilities are additionally divided into CEFR levels in which aspects of range (vocabulary), accuracy, fluency, interaction, and coherence are described.

Raters

In order for raters to achieve a common understanding and application of a scale, rater training is an important part of assessing speaking. As the standard for speaking assessment procedures involving high-stakes decisions is an inter-rater reliability coefficient of 0.80, some variability among raters is expected and tolerated. Under optimal conditions, the sources of error that can be associated with the use of a scale are expected to be random rather than systematic. Therefore, research aims to identify and control systematic error resulting from rater performance.

One type of systematic error results from a rater's tendency to assign either harsh or lenient scores. When a pattern is identified in comparison to other raters in a pool, a rater may be identified as negatively or positively biased. Systematic effects with respect to score assignment have been found in association with rater experience, rater native language background, and also examinee native language background. Every effort should be made to identify and remove as their presence negatively affects the accuracy, utility, interpretability, and fairness of the scores we report.

With fairness at issue, researchers have studied factors affecting ratings. Brown (1995) compared differences across Japanese language teachers and professional tour guides in their assignment of scores to 51 Japanese tour guide candidates. While no differences were found in the scores assigned, the two pools of raters did apply different criteria in their score assignments: teachers tended to focus on grammar, vocabulary, and fluency while tour guides tended to focus on pronunciation. Chalhoub-Deville (1995) examined the performance of three rater groups who differed in professional background and place of residence (Arab teachers residing in the USA and nonteaching Arabs residing in the USA or in Lebanon) and found a tendency for the teachers to rate grammar more harshly in

comparison to the nonteaching groups who emphasized communicative success. Chalhoub-Deville and Wigglesworth (2005) compared native-speaking English raters from Australia, Canada, the UK, and the USA and found raters from the UK harshest while raters from the USA were the most lenient. Differences in raters' application of a scale have been found not only across raters of different backgrounds and experiences, but also across trained raters of similar backgrounds.

Studies comparing native speaker and nonnative speakers as raters have produced mixed findings. While some studies have identified tendencies for non-native speakers to assign harsher scores (Ross, 1979), others have found the opposite to be the case (Winke, Gass, & Myford, 2011). In Winke et al., raters with first language backgrounds that matched those of the candidates were found more lenient when rating second language English oral proficiency, and the authors suggest that this effect may be due to familiarity with accent. In an attempt to ameliorate such potential effects, Xi and Mollaun (2009) provided special training for Indian raters who were evaluating the English language responses of Indian examinees on the TOEFL iBT. While the performance of the Indian raters was found comparable to that of Educational Testing Service raters both before and after the training, the Indian raters showed some improvement and increased confidence after participating in the training. Far fewer studies have been conducted on differences in ratings assigned by interviewers; however, there is no reason to expect that interviewers would be less subject to interviewer effects than raters are to rater effects. Indeed, in an examination of variability across two interviewers with respect to how they structured the interview, their questioning techniques, and the feedback they provided, Brown (2003) identified differences that could easily result in different score assignments as well as differences in interpretations of the interviewee's ability.

These findings underscore the importance of rater training; however, the positive effects of training tend to be short-lived. In a study examining rater severity over time, Lumley and McNamara (1995) found that many raters tended to drift over time. The phenomenon of rater drift calls into question the practice of certifying raters once and for all after successfully completing only a single training program and highlights the importance of ongoing training in order to maintain rater consistency. A more important concern raised by studies of rater variability—one that can only be partially addressed by rater training—is whose standard, whether that of an experienced rater, of an inexperienced rater, of a teacher, of a native speaker, or of a non-native speaker is the more appropriate standard to apply.

Conclusion

Bachman (1990) argued that in order to

maximize the reliability of test scores and the validity of test use, we should . . . provide clear and unambiguous theoretical definitions of the abilities we want to measure and specify precisely the conditions, or operations that we will follow in eliciting and observing performance. (p. 90)

Choices with respect to methods, scales, and raters are therefore critical in assessment of speaking.

Assessment of Translation

SONIA COLINA

Introduction

The focus of this entry is the assessment of translated texts for *summative* purposes; that is, for the purpose of offering a summary recommendation, rather than to provide feedback for learners or as a diagnostic tool (level placement, entrance exams, professional practice, and so forth). Reference, however, will be made to related areas such as the assessment of translator competence, student translation assessment, and so on (for more on areas of evaluation, see Martínez Meliz & Hurtado Albir, 2001). A translated text, also known as the *target text*, is defined here as a text that fulfills or attempts to fulfill a certain function in a target culture (in accordance with a set of explicit or implicit instructions, known as the *translation brief*) and that bears a translation relationship to another text in another language, the *source text* (ST); the specifics of a translation relationship (versus version, adaptation, etc.) can vary from one culture to another. This discussion takes the position that a translated text comes about as the result of the interaction of social participants (minimally, the writer, the target language audience, and the translator) and a purpose (often, but not always, the same as that of the original). While in the educational literature assessment and evaluation often refer to different concepts, here they will be used interchangeably, given that the content and ideas presented apply to both notions.

The assessment/evaluation of translation quality remains a controversial, long-standing issue both in translation studies and in applied linguistics. Despite extensive debate on various fronts, little agreement exists as to how translations should be evaluated. This lack of agreement has come to the forefront in recent publications, no doubt as a result of the increased demand for translations throughout the world. As the volume of translated materials increases, so does the number of translators and language professionals who lament the low quality of the materials published for public consumption (see Colina, 2008 about the *Hablamos Juntos* experience with quality). In some countries, like the United States, federal mandates (e.g., White House Executive Order #13166, 2000) ordering the provision of language services for patients with limited English proficiency have brought the topic of translation quality to wider audiences. Quality acquires even greater significance with respect to the training and education of translators and language professionals. In fact, a systematic, research-based approach to translation quality evaluation has significant implications for a number of areas in applied linguistics because translation quality evaluation plays an important role in the assessment of translator competence, student competence, and language proficiency; translation quality evaluation can also be used to determine the textual adequacy and appropriateness of translated texts as means of intercultural communication, assessing thus the success or failure of a translation.

The lack of consensus amongst existing approaches to translation quality assessment can be partially understood as the result of the elusive nature of quality, and more specifically of a multiplicity of views about translation: an evaluator's approach to quality will generally reflect his/her own views on translation. As Juliane House puts it: "Evaluating the quality of a translation presupposes a theory of translation. Thus different views of translation lead to different concepts of translational quality, and hence different ways of

2 ASSESSMENT OF TRANSLATION

assessing quality” (House, 1997, p. 1). Theories of translation are quite diverse, as a quick glimpse at the table of contents of any introductory monograph to translation studies will reveal. Establishing some common ground amongst approaches can also be difficult because some proposals and evaluation tools do not rely on any explicit theory, but rather on unarticulated views of translation passed on through training and professional socialization; furthermore, approaches to quality assessment often reflect varied objects of evaluation as well as unstated priorities responding to different evaluative purposes. Given this scenario, it is crucial to identify and define the purpose and object of evaluation. This entry focuses on the assessment of translation products, and on translation-specific quality, rather than on the business processes that led to it. While one cannot deny that a flawed production process can have a serious impact on the quality of a translation and that translation products constitute one source of evidence for investigating and assessing translation processes and competence (either those of the individual who produced it or those of the organization that commissioned it), establishing the connection between the product and the process that gave rise to it requires additional steps well beyond the objectives of this entry. Thus, the emphasis here is on evaluation of translations as products, independent of the procedures and competencies used to produce them. By “product” it is meant both the written text and its context (linguistic and extralinguistic). The extralinguistic context refers to factors such as the intended audience of the translation, its purpose, medium (verbal, nonverbal, and graphic, etc.), and the motive for its creation.

Major Approaches to Translation Evaluation

Some methods of translation quality assessment are experiential. While they are usually based on a wealth of practical experience, they lack a theoretical or research foundation, often consisting of ad hoc marking scales developed for the use of a particular professional organization or industry, for example, the American Translator’s Association (ATA) certification exam, the SAE J2450 Translation Quality Metric for the automotive industry, the LISA Quality Assurance (QA) tool for localization. Experiential methods of evaluation are outside the scope of this entry, which deals with methods framed within a theoretical or empirical approach.

Existing methods of evaluation with either a theoretical or empirical approach tend to focus on the user of a translation or on the text. They have also been classified as equivalence-based or nonequivalence-based (functionalist) (Lauscher, 2000).

Much criticism of equivalence-based models is related to their dependence on the notion of equivalence, a vague and controversial term in translation studies that is probably as difficult to define as quality or indeed translation itself (Hönig, 1997). Furthermore, equivalence-based models do not contemplate translation situations which do not have equivalence as their goal: some translations are commissioned for a somewhat different function than that of the original; in addition, a new audience and time, among other factors, may require a slightly different function than that of the source text (see Hönig, 1997, for more on the problematic notion of equivalence). One can thus say that reliance on an a priori notion of equivalence is problematic and limiting in descriptive as well as explanatory value. Some of the best-known equivalence based-models are reader-response approaches, and textual approaches, such as Reiss (1971) and House’s functional pragmatic model (1997, 2001).

Equivalence-Based Approaches

Reader-response approaches evaluate the quality of a translation by determining whether readers respond to it in the same way readers of the source respond to the original (Nida,

1964; Carroll, 1966; Nida & Taber, 1969). More specifically, the quality of the translation of, for instance, a poem would be measured by comparing the responses of the readers of the original poem to those of the translation and establishing their equivalence. In that sense, the reader-response approach is equivalence-based and reader-oriented.

It is not difficult to see the problems involved in trying to measure reader response; one in fact wonders whether it is actually possible to determine whether two responses are equivalent, given that even monolingual texts can trigger nonequivalent reactions from slightly different groups of readers. Since, in most cases, the readership of a translated text is different from that envisioned by the writer of the original, equating quality with equivalence of response seems to pose more questions than answers. Additionally, how a reader responds to a text is not equally important for all texts, in particular for texts that are not reader-oriented (e.g., legal texts); as a result, reader response, as a method of quality assessment, will not be equally informative for all types of translation. Along similar lines, reader response addresses only one aspect of a translated text (i.e., equivalence of effect on the reader), ignoring others, such as the purpose of the translation, which may justify or even require a slightly different response from the readers of the translation. Finally, as with many other theoretical approaches, reader-response testing is time consuming and difficult to apply to actual translations. At a minimum, careful selection of readers is necessary to make sure that they belong to the intended audience for the translation.

Despite being problematic, reader-response methods must be credited with recognizing the role of the audience in translation—more specifically, of translation effects on the reader as a measure of translation quality. This is particularly noteworthy in an era when the dominant notion of “text” was that of a static object on a page.

Another equivalence-based model, Reiss (1971), argues that the text type and function of the source text is the most important factor in translation and that quality should be assessed with respect to it.

House's (1997, 2001) *functional-pragmatic model* relies on an analysis of the linguistic-situational features of the source and target texts, a comparison of the two texts, and the resulting assessment of their match. The basic measure of quality is that the textual profile and function of the translation match those of the original, the goal being functional equivalence between the original and the translation. Perhaps one of the most significant objections to House's functional model is its dependence on the notion of equivalence, which is, as mentioned earlier, a problematic and controversial term in translation studies.

The *argumentation-centered approach* advanced by Williams (2001, 2004) is a textual approach to quality evaluation in which evaluation is based on argumentation and rhetorical structure. This approach is also equivalence-based, as “a translation must reproduce the argument structure of ST to meet minimum criteria of adequacy” (Williams, 2001, p. 336). Argument structure is used in a broad sense that covers not only argumentative texts, but also narratives, dialogue, and descriptions; one of the main contributions of this method is its macro-textual approach to quality evaluation, where an error in argumentation schema is considered a major error. Other equivalence-based models of evaluation are Gerzymisch-Arbogast (2001), Neubert (1985), and Van den Broeck (1985).

Despite the reliance of some on equivalence and the difficulties involved in trying to apply them, the above *textual and pragmatic approaches* to translation quality have made a significant contribution to the field of translation evaluation by shifting the focus from counting errors at the word or sentence level to evaluating texts and textual structure, giving the reader and communication a much more prominent role in the translation process.

Nonequivalence (Functionalist) Approaches

Bowker's *corpus-based model* (2001) uses “a comparatively large and carefully selected collection of naturally occurring texts that are stored in machine-readable form” as a

4 ASSESSMENT OF TRANSLATION

benchmark against which to compare and evaluate specialized student translations. Bowker (2001) is a novel, valuable proposal for the evaluation of students' translations that does not rely on textual equivalence.

For *functionalism* (also known as Skopos Theory) (Reiss & Vermeer, 1984; Nord, 1997), the text type and function of the translation are the criteria guiding translation decisions; consequently, they should also be the criteria guiding evaluation. In this model, the specifications for the target text, the *translation brief*, are of paramount importance in determining the quality of the translation.

Criticism leveled at textual and functional models of evaluation often has to do with the difficulty involved in applying these models in professional contexts (Lauscher, 2000; Colina, 2008). Corpus-based models can be very time consuming, as they require the preparation of special evaluation corpora. Functional approaches to evaluation remain vague as to how evaluation is to proceed after the function of the translation has been established as the guiding criterion for making translation decisions. Höning, for instance, after presenting some strong arguments for a functionalist approach to evaluation, does not offer any concrete instantiation of the model. He comes to the conclusion that "the speculative element will remain—at least as long as there are no hard and fast empirical data which serve to prove what a 'typical' reader's responses are like" (1997, p. 32). As part of a critical review of existing translation assessment approaches, Lauscher concludes that in order to bridge the gap between theoretical and practical quality assessment, "translation criticism could move closer to practical needs by developing a comprehensive translation tool" (2000, p. 164). As seen here, many approaches to evaluation center around partial aspects of quality.

Colina (2008) proposes a *functional-componential approach* to translation quality evaluation in which translation products are evaluated relative to the function of the text and the characteristics of the audience specified for the translated text. The model is also *componential* in that it evaluates components of quality separately; Colina (2008) argues that without explicit criteria on which to base their evaluations, evaluators often rely on their own priorities, which may or may not coincide with the requester's. In an attempt to introduce flexibility with regard to different conditions influencing quality and to state explicit priorities regarding various aspects of quality, the functional-componential approach incorporates a user-defined notion of quality in which it is the user or requester who decides which aspects of quality are more important for his or her communicative purposes. This is done either by adjusting customer-defined weights for each component or simply by assigning higher priorities to some components. Customer weighting of components also allows for customization depending on the effect of a particular component on the whole text, which may vary depending on textual type and function. The functional-componential approach does not rely on a point deduction system; rather, it tries to match the text under evaluation with one of several descriptors provided for each category/component of evaluation.

In order to show the applicability of the model in practical settings, and to develop testable hypotheses and research questions, Colina and her collaborators designed a tool based on the functional-componential tool. They also tested it for inter-rater reliability (see Colina, 2008, 2009). Results show good inter-rater reliability for Spanish and Chinese health education materials.

A similar view of quality, as comprehensive and customer-defined, made up of different components and priorities that may vary according to the situation, is presented by Lauscher, who argues that

the translation process is guided by case-specific values. These values . . . are set and agreed by the interested parties during the translation process. In order to judge the quality of a translation, the values should be made accessible to the evaluator and operationalized

as evaluation parameters. Because the application of evaluation parameters depends on situational and individual factors, translation quality is ultimately a matter of agreement and consensus. (2000, p. 149)

In sum, some recent quality assessment proposals, such as Lauscher (2000) and Colina (2008, 2009), allow for variable notions of quality, depending on case-specific values and customer-defined and negotiated quality criteria, and may thus be more flexible and adaptable to various purposes and translation views.

Applications

The evaluation of translation texts is one obvious application of the translation assessment models. Yet, as explained above, some approaches have been criticized for being too theoretical and difficult to apply to actual texts. Another area where translation quality assessment has obvious applications is translation teaching, in particular in relation to the *assessment of translator competence*. It is important to note that, while the quality of a translation product constitutes one important source of data to assess translator competence, the quality of a product is only one indicator of competence that needs to be complemented with other types of evidence. Generally, one can safely assume that a good-quality translation is the reflection of a competent translator; however, in translation, errors in various subcomponents of quality do not always translate into lack of competence in the relevant subcomponent. An example is the well-known case of *transfer without ignorance*, where novice translators with native proficiency in the target language have been shown to produce linguistically inadequate translations (Colina, 1999). Novice translators are known to use a sign-oriented approach to translation, focusing on words and small linguistic units (see Colina 2003, p. 34, and references therein), the result being a linguistically deficient target language text.

Among recent proposals for the assessment of translator competence are Colina (2003) and Angelelli (2009); both are componential approaches, based on existing models of translation competence, that evaluate subcomponents of competence. Other proposals for the evaluation of student translations that must be classified as methods rather than approaches are Eyckmans, Anckaert, and Segers (2009) and Waddington (2001). Eyckmans et al. (2009) compare the reliability of holistic, analytical, and “item” methods. In an “item” method, evaluation is carried out by reference to a number of preselected items that constitute the norm or standard. This method is considered less subjective than those based on pre-established criteria because it is norm-referenced. Some disadvantages of an item method are that it is very time consuming and that items need to be selected for each text to be evaluated on the basis of the mistakes made by a representative number of students; the item method, however, can be appropriate for standardized tests in a summative context. With a focus on methods as well, Waddington (2001) tests the validity of holistic, error-analysis, and mixed (holistic plus error-analysis) methods of evaluation, based on pre-established criteria. The approach underlying the criteria, however, is not discussed. Within the context of autonomous learning, some scholars have also proposed peer-to-peer evaluation and self-evaluation methods (e.g., digital portfolio, Rico 2010).

Both translation studies and applied linguistics stand to benefit from theoretical and empirical research in translation evaluation. Given the complexity of the topic and the variety of views and perspectives on quality, for the field to move ahead it is crucial that work in this area include an explicit discussion of the approach used, as well as the purpose and scope of evaluation; it is also important that proposals be subject to empirical verification and can be applied in professional and educational settings, as the potential and need for applications is also significant.

Assessment of Vocabulary

JOHN READ

Introduction

Vocabulary is such an integral component of language use that to some degree any form of language assessment is a measure of vocabulary ability, among other things. However, assessing vocabulary is normally understood to be a process of testing learners' knowledge of a sample of content words, not simply to find out whether they know those particular words but to investigate their ability to understand and use vocabulary in a more general sense.

It is useful to explore a little further what is meant by vocabulary. Most commonly, for assessment purposes, vocabulary is defined in terms of individual words, but the concept of a "word" is itself a slippery one, as is illustrated by the following sets of word forms:

- | | | | | |
|-------------|----------|--------------|--------------|--------------|
| (1) shout | SHOUT | <i>shout</i> | shout | |
| (2) save | saves | saving | saved | |
| (3) product | products | production | productive | productivity |
| (4) sea | season | seal | search | seamless |

In Set 1 we have different typographic forms of the same word, with the capital letters and the alternative fonts perhaps indicating added emphasis rather than any difference in meaning. Although the word forms in Set 2 are a little more distinct, we can see them as representing different grammatical functions of the same word. In the third set, we can recognize that the words have a common stem form (*product*) and a shared underlying meaning, but the individual items in the list are more like related but separate words (i.e., members of the same family), as compared to the word forms in the first two sets. On the other hand, the items in Set 4 are superficially similar in form, in that they all begin with *sea-*, but they are obviously different words.

From an assessment perspective, there are two points to make here. First, if a vocabulary-test item targets a particular word form and test takers answer correctly, can we also credit them with knowledge of related words? For instance, if learners show that they understand *product*, is it reasonable to assume that they also know *production* and *productive*? The other point is that, even at the level of the individual word, we are not dealing purely with vocabulary; Sets 2 and 3 above show how the grammatical functioning of words is an essential part of vocabulary knowledge.

Moving beyond individual word forms, we increasingly recognize that vocabulary also consists of fixed combinations of words, variously known as compound nouns (*ironing board*) phrasal verbs (*put up with*), collocations (*heavy rain*), idioms (*shoot the breeze*), formulaic sequences (*I declare the meeting closed*), lexical phrases (*as a matter of fact*), and so on. To the extent that these multiword units are included in vocabulary tests, they are often treated as if they were single words, but such items have received little attention in their own right in language assessment.

Selection of Target Items

Once the lexical units that are the focus of the assessment have been defined, the next step is to select a sample of those units, and the basis for that selection depends on the context. For example, in the classroom situation, the vocabulary that the learners need to know is commonly specified in the coursebook, the syllabus, or other components of the language curriculum. For more general purposes, word-frequency lists are used as a key reference, on the principle that higher-frequency words are more useful to, and more likely to be known by, learners than words which do not commonly occur in the language. The classic sources of word-frequency information for ESL vocabulary tests are West (1953) and Thorndike and Lorge (1944).

With the advent of computer corpus analysis, other influential frequency lists have been published, both for British English in general (e.g., Leech, Rayson, & Wilson, 2001) and for academic writing in particular (Coxhead, 2000). Another recent innovation, going beyond individual words, is the academic formulas list (Simpson-Vlach & Ellis, 2010). The widespread availability of corpus tools means that individual institutions can compile corpora and word lists for their own purposes. Corpus software can not only count the occurrence of words but can also help to identify vocabulary that is distinctive to particular disciplines, genres, or types of text. Although some spoken-English corpora have been produced (e.g., McCarthy, 1998; Simpson, Briggs, Ovens, & Swales, 2002), it remains much more practical to create corpora of written texts and so there is less comprehensive information about the frequency and uses of words in speech.

It should be pointed out, though, that not all vocabulary measures involve preselecting of the lexical items to be assessed. With measures of comprehension and use of vocabulary, described later in this entry, it is texts or tasks that are selected rather than words.

Design of Assessments

Once the target lexical items have been identified, the other main issue is the design of the assessment items or tasks. The choice of design involves a variety of considerations but, to provide a framework for the discussion, let us take the widely recognized distinction between receptive and productive knowledge of vocabulary. Although the exact nature of this division is still debated by scholars, all language users have a strong sense that the number of words they can understand is rather larger than the number that they use actively in their own speech or writing. Read (2000, pp. 154–7) further subdivides the distinction into recognition versus recall and comprehension versus use, which can provide a useful basis for classifying types of assessment and reflecting on what kind of vocabulary knowledge is actually being assessed.

Recognition

The first level of vocabulary knowledge involves whether learners can recognize and attribute meaning to a lexical item when it is presented to them in isolation, based on the idea that the core element of word knowledge is the ability to establish a link (which ultimately should be automatic) between the form of an L2 word and its meaning. This kind of test has often been criticized for a negative effect in encouraging learners to engage in too much supposedly unproductive study of decontextualized word lists, but there is a strong counterargument that the learning of high-frequency vocabulary using effective mnemonic techniques is an efficient means of establishing a foundation for rich vocabulary development (Hulstijn, 1997; Nation, 2001, pp. 297–303). This issue aside, recognition-type tests have been shown to work effectively for a variety of assessment purposes.

The simplest form of recognition assessment is the yes/no format, in which the test takers are presented with a set of words and are simply asked to indicate whether they know the meaning of each one or not. The list might begin as follows:

bag
ill
predict
estle
seminar
broccoli
sanglous

Obviously this format depends on self-report and is unsuitable for higher-stakes assessment situations in which learners have a vested interest in overstating their knowledge. It includes an indirect validity check in that a certain proportion of the items are not actual words (like *estle* and *sanglous* in the list above), which provides a basis for adjusting the scores of test takers who claim knowledge of such words. Research shows that the effectiveness of the format varies to some extent according to the learners' background but it can be a very useful means of estimating vocabulary size and even a quick method of indicating the learner's level of language competence.

A more widely used approach to assessing recognition knowledge is to require the test takers to show that they can associate each L2 word with an expression of its meaning, which may be in the form of a synonym or short definition in L2, or—if the learners share a common language background—an equivalent expression in their own language. The classic format of this kind is multiple-choice, where typically the target word is presented in a short, non-defining sentence, together with four possible synonyms or definitions. For young children and other non-literate learners, an oral version of multiple-choice is the picture-vocabulary format, in which the test taker listens to a word as it is spoken by the person administering the test and chooses which of four pictures represents the word meaning.

Recall

The second level of vocabulary knowledge involves the ability to recall the target word from memory when prompted to do so. This is the converse of recognition and it is acknowledged to be a more challenging task, requiring a stronger form-meaning link in the learner's mind. Another way in which a recall item demands more of test takers is that, whereas recognition assessment typically requires them to *select* a response from those provided, with recall the test takers must *supply* the target word. Thus, one kind of recall task is simply to present the learners with a set of meanings, perhaps in the form of words or phrases in their own language, and require them to provide the L2 equivalent of each one. Labeling of objects in a picture or processes represented in a diagram are other ways in which the learners' ability to recall vocabulary items can be assessed.

Perhaps the most commonly used form of recall assessment is the gap-filling task. In its simplest form, the items consist of sentences from which one content word has been deleted, like this:

I went to borrow a book from the _____.

The task is to write in the missing word. It should be noted that this type of item is more difficult to score than a selected-response item. First, there are often several possible words

4 ASSESSMENT OF VOCABULARY

that can fill the blank, some of which may be more acceptable than others. In this case, *library* is the intended answer, but *librarian*, *teacher*, and *shelf* also fit the gap. Second, having to supply the word means that test takers may misspell it or provide the incorrect grammatical form. This raises the question as to whether the focus of a recall item is simply on meaning, so that a word form which fits semantically is acceptable even if it is in the wrong form, or whether the gap-filling task provides the opportunity to assess various other aspects of word knowledge as well. These include not only spelling and grammar but also, for more advanced learners, aspects such as collocation and idiom, as in these examples:

To stay awake, they drank several cups of _____ coffee. [*strong*]

Several people claimed to have seen the missing girl, but these were all red _____.
[*herrings*]

Recall tasks can be based on paragraphs or longer texts, with multiple deletions, rather than just separate, unrelated sentences with a single gap. Such tasks are often referred to loosely as cloze tests. However, it is important to note that in the standard cloze procedure words are deleted at fixed intervals (e.g., every seventh word) so that all types of word can be omitted, including articles, prepositions, conjunctions, and other function words. A standard cloze obviously draws on vocabulary knowledge but, if a text-based gap-filling task is to assess directly the ability to recall lexical items, it should be nouns, verbs, adjectives, and adverbs that are selectively deleted.

Comprehension

If a gap-filling task may be text-based, can it really be considered a measure of vocabulary, rather than, say, reading-comprehension ability? It may no longer be seen as a pure vocabulary test, but the underlying issue here is whether vocabulary acquisition is an end in itself or a means for the learner to use the second language more effectively for a variety of communicative purposes. At this point we move on to the second way of distinguishing receptive and productive vocabulary knowledge, namely comprehension versus use. The recognition and recall formats we have just discussed are intended to monitor learners' developing vocabulary knowledge, but they provide at best quite indirect evidence of whether learners can access their knowledge of words and exploit them effectively in performing real language-use tasks.

In the case of comprehension, we are interested in the learners' ability to deal with vocabulary in texts which have the characteristics of natural spoken and written discourse. Depending on the learners' goals, the texts may represent conversations, lectures, train-station announcements, or video clips; and newspapers, novels, college textbooks, or e-mails. Comprehension tasks oblige the test takers to process the vocabulary in real time, which means they need both automatic recognition of high-frequency words and the ability to process the input in chunks rather than word by word. This constraint is more obvious with respect to listening tasks, given the fleeting and ephemeral nature of speech, but it also applies to reading if the learners are to achieve adequate comprehension of the overall text. The test takers also need to understand lexical items in a rich discourse context, rather than as independent semantic units.

One important step in selecting texts for comprehension assessment is to evaluate the suitability of the vocabulary content for the learners' level of proficiency in the language, since it is unreasonable to expect them to understand a text containing a substantial number of unknown lexical items. Traditionally, this step is assisted by applying a standard readability formula, such as the Flesch Reading Ease score or the Flesch-Kincaid Grade Level

score (both available on Microsoft Word), incorporating word frequency as a core component. Another approach is to submit the text to the VocabProfile section of the Compleat Lexical Tutor (www.lextutor.ca), which offers both color coding and frequency statistics to distinguish common words from those that occur less frequently. It should be noted that both these approaches are word-based, so they may underestimate the lexical difficulty of texts containing idiomatic or colloquial expressions.

Vocabulary assessment for comprehension purposes is embedded, in the sense that it engages with a larger construct than just vocabulary knowledge or ability. In practical terms, this means that the vocabulary-test items form a subset of items within the test. In addition, the focus of the items changes from simply eliciting evidence of the ability to recognize or recall word meanings to contextual understanding, through reading items like these:

The word “inherent” in line 17 means . . .

Find a phrase in paragraph 3 that means the same as “analyzing.”

Items may also assess lexical-inferencing ability by targeting vocabulary items that the test takers are unlikely to know, but whose meaning can reasonably be inferred by clues available in the surrounding text.

By its nature, reading assessment offers more scope for items that focus on individual lexical units in the text than listening assessment, because a written text remains available for review in a way that a spoken text does not. In fact, it may be counterproductive to encourage learners to concentrate on vocabulary in a listening task, as Chang and Read (2006) found in their investigation of various forms of support for EFL learners taking a listening test. Pre-teaching of key lexical items proved to be the least effective form of support, apparently because it drew the test takers’ attention away from the propositional content of the text. On the other hand, if spoken or written texts represent a particular discipline, register, or genre, comprehension-test items will provide at least indirect evidence of the ability to handle vocabulary appropriate for that type of text (see Read, 2007, for further discussion of this point), even if none of the test items focus explicitly on vocabulary.

Use

Use refers to the ability of learners to draw on their vocabulary resources in undertaking speaking or writing tasks, like giving a talk, participating in a conversation or discussion, composing a letter, writing an essay, or compiling a report. This represents a more genuine sense of production than a recall task such as supplying a content word to complete a gap in a sentence. One characteristic of vocabulary-use tasks which distinguishes them from the other three approaches outlined above is that the task designer cannot normally target particular lexical items by requiring the learners to incorporate specific words into what they produce. Thus, the choice of words can only be influenced indirectly by the choice of task and topic, or by the selection of appropriate input material: source texts, pictures, diagrams, and so on.

As with comprehension tasks, use tasks can be assessed purely as measures of the learners’ vocabulary ability or as measures of a larger speaking or writing construct in which vocabulary is embedded as one component. Vocabulary researchers have devised a variety of statistics to evaluate the lexical characteristics of texts: How many different words are used? What percentage of the words are low-frequency items? What percentage are content words? Until now, the statistics have not been very practical tools for assessment purposes but recent advances in automated writing assessment, in which lexical measures play a

prominent role, mean that automated assessments may quite soon complement human ratings in large-scale proficiency-test programs like TOEFL (Jamieson, 2005).

For now the more common practice in speaking and writing tasks is for the teacher, or the rater in the case of a more formal test, to assess the learners' use of vocabulary by means of a rating scale. For example, in the speaking module of the International English Language Testing System (IELTS; see www.ielts.org), lexical resource is one of four criteria that the examiners apply to each candidate's performance, along with fluency and coherence, grammatical range and accuracy, and pronunciation. Highly proficient candidates are expected to use a wide range of vocabulary accurately and idiomatically, whereas those with more limited speaking proficiency are restricted to talking about familiar topics and lack the ability to paraphrase what they want to say. Thus, such assessments are based on raters' perceptions of general lexical features of the test takers' task performance, rather than on any individual vocabulary items.

Conclusion

Given the central role of vocabulary in language acquisition and use, a whole range of procedures is needed to assess learners' developing vocabulary ability in a second language. Much depends on the purpose of the assessment. For beginning and intermediate learners, who are building their core knowledge of high-frequency words, recognition and recall formats have an important role in monitoring their lexical development. Such formats are also useful in placement and diagnostic tests. However, as learners' competence in the second language advances, we need to assess their ability to draw on their vocabulary resources effectively for functional communication by means of comprehension and use tasks.

Assessment of Writing

SARA CUSHING WEIGLE

The importance of writing in the 21st century cannot be overestimated. As globalization brings people together from different linguistic and cultural backgrounds and the Internet and other technologies allow for instantaneous long-distance communication, the written word has taken on increased significance. For those teaching and learning second languages, the need to assess writing ability accurately and effectively has also increased. To address this need, researchers and test developers have devoted much time and attention to improving the practice of writing assessment by investigating the factors that influence performance on writing tests and increase the reliability and validity of these assessments. This entry provides a short summary of this research.

Purposes of Writing Tests

Why do we test writing? Books on language testing (e.g., Brown, 2005) generally distinguish between four main purposes for language tests in academic settings: proficiency, placement, diagnostic, and achievement. A proficiency test is not tied to any particular curriculum but is intended to give an overall assessment of language ability, often to predict how well students will function in academic settings. Writing tests are frequently included as part of a language proficiency test such as the Test of English as a Foreign Language Internet-Based Test (TOEFL iBT®) or International English Language Testing System (IELTS). A placement test is used to determine where a student fits in a particular curriculum. In a general language program writing tests are often used in combination with tests of other language skills for placement; however, writing tests are also widely used in the USA and other countries to place students into first-year composition courses at the university level (see White, 1994). Diagnostic and achievement tests tend to be (although are not always) classroom-based assessments; diagnostic tests are used to identify specific areas of strength and weaknesses, while achievement tests are used to determine whether students have mastered specific skills or knowledge that has been taught. Outside of the academic world, writing tests are often used for job selection or advancement.

The remainder of the entry is organized as follows. First is a discussion on the nature of writing in a second language. Next follows a discussion on research and practical considerations in designing writing assessments, particularly as they relate to task design and scoring procedures. Finally there is a discussion on some recent trends in writing assessment.

The Nature of Second Language Writing

Applied linguistics is traditionally concerned with learning and teaching a second language. Thus, when we discuss writing assessment in applied linguistics, we usually refer to assessing writing in second or foreign language contexts rather than assessing first language writing. Thus assessing second language writing is often a matter of evaluating second language proficiency through the means of writing, as opposed to the degree to which first

2 ASSESSMENT OF WRITING

language speakers have mastered writing conventions. However, the two are not always distinguishable; many L1 writing concerns are also issues for L2 writing, particularly in academic settings. The degree to which first and second language writing assessments are distinct is related to a number of considerations, including age, context of learning, and proficiency level, described below.

Age: Because younger learners tend to be learning to write in their first language, they are developing literacy skills in both their first and second language. In contrast, older learners, depending on their background and history, may or may not have literacy skills in their first language. If they do, they can transfer many of the strategies from their first language onto their second; if they do not, then “writing” may simply refer to basic literacy skills.

Context (i.e., second vs. foreign language): Students learning to write in a second language context generally need to write for school or sometimes work purposes. These students have an immediate need to master the genres and conventions of writing in that language. In a foreign language context, writing may be used to reinforce and practice the language structures (grammar and vocabulary) learned in class rather than as authentic communication. In some situations, foreign-language learners may never actually need to write in their second language outside the classroom.

Proficiency level: At the earliest stages of language learning, writing is limited to the specific vocabulary and grammar that have been learned; again, writing at this stage may be more appropriately used for reinforcing and practicing language structures. As students gain proficiency in the language, the focus in writing can be more on content development and organization and less on the specifically linguistic aspects of writing.

These factors, among others, will determine whether language (i.e., displaying language ability by means of writing) or writing (i.e., communicating in writing by means of a second language), or some combination of the two, will be the main focus of assessment (for a relevant discussion of similar considerations from the perspective of performance assessment see McNamara, 1996, chap. 2).

Types of Writing Assessments

One way to think about types of writing assessments is as a continuum from least to most authentic, in terms of the degree to which they simulate real-world writing conditions. At one end of the continuum we can make a distinction between an indirect test of writing and a direct test. An indirect test attempts to measure the subskills involved in writing (particularly grammar and usage) via multiple choice or other selected response measures. Such measures were prevalent in the USA in the 1970s and 1980s (White, 1994). A direct test of writing requires the examinee to produce a continuous piece of prose in response to a set of instructions, and has the following additional characteristics (Hamp-Lyons, 1991): responses are ordinarily at least 100 words; the instructions, or prompt, provides direction but allows the candidate considerable leeway in responding; each response is read by at least one (preferably two) trained raters using a common scale, and the result is a number rather than (or in addition to) a verbal description of the writing. Typical writing tests are also conducted under timed conditions and the topic is frequently, if not usually, unknown to the candidates in advance (Weigle, 2002).

On the other end of the continuum of authenticity is portfolio assessment, which allows writing to be assessed over time and over a range of writing tasks and genres. A portfolio can be defined as “a purposeful collection of student works that exhibits to the student (and/or others) the student’s effort, progress, or achievement in a given area” (Northwest

Evaluation Association, 1991, p. 4, cited in Wolcott, 1998). While portfolios have been implemented successfully in large-scale writing, portfolio assessment may be more feasible as a classroom assessment tool (Hamp-Lyons & Condon, 2000; Weigle, 2002, chap. 9).

In between the extremes of an indirect test of writing and a collection of texts written for authentic purposes is a variety of different task types. The impromptu timed essay based on a prompt is the most common writing assessment task, particularly for academic purposes, but by no means the only one. Impromptu writing tasks can take the form of different genres, such as letters, memoranda, or written instructions. Writing can be integrated with listening, reading, or both listening and reading in tasks that require examinees to summarize or otherwise incorporate source material from a reading or listening passage into their writing. Finally, stages of the writing process can be isolated and assessed in tasks such as writing an outline (pre-writing) or editing a paragraph or essay (revision).

Characteristics of Writing Tests: Tasks and Scoring

This section discusses research and practice regarding the most typical form of writing assessment: direct assessment. Considerations for assessing writing can be broadly divided into two categories: tasks (what the writer will respond to) and scoring (how the writing will be evaluated). From a theoretical perspective, scholars have long been interested in questions such as the effects of different task characteristics on writing test performance and how raters from different backgrounds evaluate writing samples. From a practical perspective, considerations of task and scoring provide guidance for teachers and administrators to design their own assessments or adopt commercially available tests.

Task Features

Weigle (2002, p. 63) provides a taxonomy of task dimensions for writing assessment. These can be divided into the features of the writing task itself (what test takers actually respond to) and features of the test, which include administrative and logistical considerations. Some important features of the test task include subject matter, discourse mode, and stimulus material, which are discussed briefly below.

Subject matter. Research on the effects of subject matter is limited, in part because it is difficult to separate subject matter from discourse mode or other topic variables (Hamp-Lyons, 1990). However, two broad distinctions can be made with regard to subject matter. First, some topics are essentially personal (e.g., descriptions of self or family, discussion of personal likes and dislikes) and others are nonpersonal (e.g., argument essays about controversial social issues). Research and experience suggest that nonpersonal topics may be somewhat easier to score more reliably; however, personal topics may be more accessible to all test takers and tend to elicit a wider range of responses. Within nonpersonal topics, and specifically in assessing writing for academic purposes, another distinction can be made between topics that are more general and those that are discipline-specific. Here some research suggests, not surprisingly, that students may perform better on topics related to their disciplines than on more general topics (Tedick, 1990).

Discourse mode. Discourse mode refers to the type of writing that candidates are expected to produce. The term discourse mode subsumes a cluster of task features such as genre (essay, letter, etc.), rhetorical task (e.g., narration, description, exposition), pattern of exposition (comparison/contrast, process, etc.) and cognitive demands (Huot, 1990). Research on the effects of specific features on writing test performance suggests that

4 ASSESSMENT OF WRITING

these factors may indeed influence performance in systematic ways; however, it is difficult to isolate individual factors or separate the effects of, for example, genre from cognitive demands. For test developers, perhaps the most important advice to keep in mind is to consider the authenticity of the task for specific test takers and, if test takers are offered a choice of tasks or if alternate forms of the test are used, that these discourse variables be kept as parallel as possible.

Stimulus material. While many traditional writing assessment tasks consist merely of the topic and instructions, it is also common to base writing tasks on stimulus material such as pictures, graphs, or other texts. Hughes (2003) recommends that writing tasks be based on visual materials (e.g., pictures) to ensure that it is only writing and not content knowledge that is being assessed. At the other end of the spectrum, many academic writing tests use a reading passage or other text as stimulus material for the sake of authenticity; since academic writing is nearly always based on some kind of input text. Considerations for choosing an appropriate input text can be found in Weigle (2002) and Shaw and Weir (2007).

In addition to factors involving the task itself, a number of other factors that can be considered more logistical or administrative need to be addressed when designing a writing test; some of these include issues such as time allotment, instructions, whether or not to allow examinees a choice of tasks or topics, and whether or not to allow dictionaries. For a summary of research related to these issues, see Weigle (2002, chap. 5). One issue that has gained prominence over the past two decades is whether or not candidates should write responses by hand or by using computers; clearly, the use of computers is much more prevalent than it was even 10 years ago, and several large-scale tests have begun requiring responses to be entered on a computer. Pennington (2003) reviews the literature for handwriting versus word processing; briefly, this literature suggests that, for students who have proficient keyboarding skills, using the computer leads to higher quality writing and more substantial revisions. On the other hand, several studies suggest that raters have a tendency to score handwritten essays higher than typed ones, even if they are otherwise identical (Powers, Fowles, Farnum, & Ramsey, 1994).

Scoring Features

Two important considerations in scoring a writing assessment are (a) designing or selecting a rating scale or scoring rubric and (b) selecting and training people—or, increasingly, machines—to score the written responses. Scoring rubrics can generally be divided into two types: holistic, where raters give a single score based on their overall impression of the writing, and analytic, in which raters give separate scores for different aspects of the writing, such as content, organization, and use of language. A well-known example of a holistic writing scale is the scale used for the TOEFL iBT® writing test (Educational Testing Service, 2008). An example of an analytic writing scale can be found in Lumley (2002) in addition to the references discussed below.

While both scale types have advantages and disadvantages, a holistic scale is generally preferred in situations where a large number of tests need to be scored in a short time, such as in placement testing. On the other hand, for classroom purposes, an analytic scale can provide more useful information to students. Thorough discussions of different types of rating scales can be found in Weigle (2002, chap. 5) and Shaw and Weir (2007, chap. 5).

In analytic scales, there is no consensus about what aspects of writing should be scored. Most analytic scales have at least one subscale for content/ideas, one for organization or rhetorical features, and one or more for aspects of language use. For example, the IELTS has scales for grammatical range and accuracy, lexical range and accuracy, arrangement of ideas, and communicative quality (Shaw & Falvey, 2008). The scale devised by Jacobs,

Zinkgraf, Wormuth, Hartfiel, & Hughey (1981), one of the first well-publicized analytic scales for second language writing, includes the categories of content, organization, vocabulary, language use, and mechanics. The Test of English for Educational Purposes (TEEP) (Weir, 1990) has scales for relevance and adequacy of content, compositional organization, cohesion, adequacy of vocabulary for purpose, grammar, mechanical accuracy I (punctuation), and mechanical accuracy II (spelling).

Selecting, training, and monitoring raters is a central aspect of writing assessment. Useful procedures for rater training and monitoring can be found in White (1994), Weigle (2002), and Shaw and Weir (2007). Recent research has focused on the effects of rater background and training on scores; see in particular Lumley (2005), Barkaoui (2007), and Eckes (2008) for summaries. This research suggests that training can mitigate but not completely eliminate differences in rater severity and consistency due to background variables. For this reason, many programs have begun using test analysis tools such as multi-faceted Rasch measurement (MFRM) to adjust scores for differences between raters (see McNamara, 1996, for an introduction to MFRM, and Schaefer, 2008, for a review of studies in writing assessment that have used this approach).

Another important development with regards to scoring is the use of automated essay scoring (AES) systems such as *e-rater*®, developed by Educational Testing Service (Attali & Burstein, 2006) and IntelliMetric™ and MY Access!® developed by Vantage Learning Systems (Elliott, 2003), in part to contain the costs and time involved in scoring large-scale writing assessments. Research demonstrates that automated systems are at least as reliable in scoring standard essay tests as humans (see Shermis & Burstein, 2003, and Dikli, 2006, for overviews of automated essay scoring). However, the use of AES systems is controversial; many writing instructors, in particular, are opposed to any machine scoring of writing, while others highlight the speed and reliability of AES systems as advantages. A recent review of the arguments in this area can be found in Ockey (2009).

Challenges and Opportunities for the Future

Assessment specialists have focused on designing tasks that reflect real-world writing more accurately while maintaining rigorous standards for scoring. It has long been recognized that a single timed impromptu essay is inadequate for assessing writing. The trend in large-scale writing tests is toward multiple tasks and new genres. For example, the TOEFL iBT® now includes both an independent task and an integrated writing task that is based on listening and reading (Chapelle, Enright, & Jamieson, 2008), while the Cambridge suite of exams is introducing email tasks in some tests (Shaw & Weir, 2007). These new test tasks are bound to stimulate new validity research as they become operational.

At the same time the introduction of more tasks and the need to maintain rigorous standards in scoring add to the human and financial costs of producing and scoring writing assessments. AES systems are an important way to help contain such costs; thus, the ongoing debate about the use of automated scoring is another important issue that is certain to be a focus of debate in the foreseeable future.

The importance of writing in the business world and the growth of instant global communication may also mean that new assessments for business writing will need to be developed that are specifically tailored to the genres and tasks of international business communities. This is an additional area of potential growth in writing assessment (see Katz, Haras, & Blaszczyński, 2010, for an overview of the role of writing in business).

This entry has demonstrated the complexity of assessing writing as well as the opportunities that have emerged in the electronic age. For further information on the development of writing assessment, a useful timeline of important publications in this area can be found in Cumming (2009).

Assessment of Young English-Language Learners

LINDA ESPINOSA

Introduction

Assessment of young English-language learners (ELL) is an important issue internationally. In the USA, such assessment needs are being driven by the growth of the ELL population in the past two decades. Currently, 1 in 5 children aged 5–17 in the USA has a foreign-born parent, and most of these children are growing up in a bilingual environment (Capps, Fixx, Ost, Reardon-Anderson, & Passel, 2004). Young ELL children present particular assessment challenges because of the unstable nature of early growth and development; moreover, young ELLs can have widely varying levels of English comprehension, which makes it difficult to accurately interpret the assessment results. Despite the tremendous recent growth in the population of young ELL children, the corresponding development of a range of different types of appropriate measures and procedures for ELL children has not kept pace with this growing need. However, recently some positive developments have been made.

Challenges in Young ELL Assessment

Young ELL children, whether simultaneous or sequential second language learners, most likely will have a dominant language (Genesee, Raradis, & Cargo, 2004), even though the differences may be subtle. This is the language the child should first be assessed in to determine the upper limits of the child's linguistic and cognitive ability; however, there are no individual child assessments specifically designed to determine language dominance.

Many of the currently available measures for ELL children have been developed essentially as basic translations or adaptations of existing English-language versions of measures, with varying levels of attention paid to ensuring comparability in the conceptual, linguistic, or semantic content or level of difficulty of the translated items across languages, or both. As such, the content validity and construct validity may not be the same for the two versions of the same measure. Moreover, the actual developmental construct that is being assessed by a measure may vary from one language to the next.

Many standardized assessment measures (both in English and other languages) contain a very small pool of test items to assess a given skill or ability of interest. Since many existing assessments are designed to assess a number of different skills and abilities, the number of items for any given task is small, so as not to end up with an assessment that will be far too lengthy or frustrating for the shorter attention span of most preschool-age children, or both. However, the inclusion of a greater number of items is one way to help to offset this inherent variability and improve the precision of the measures.

Reliability coefficients for many standardized tests are lower for ELL children even if they have been designated as fully proficient in English (Abedi, Hofstetter, Baker, & Lord, 2001). The concurrent validity scores for ELL children have also shown to be substantially lower for ELL students. A small number of studies that examined the psychometric

properties of wide-scale English reading tests met the criteria for inclusion in the *Developing Literacy in Second Language Learners* report (August & Shanahan, 2006). In general they found the reading tests to be reliable (Davidson, 1994), but to have questionable construct validity for ELL children (Garcia, 1991; Pomplun & Omar, 2001; Abedi, 2004). These researchers have argued that unfamiliar English vocabulary and complex language demands of the test items unfairly depress ELL children's performance. Abedi (2004) further found that ELL scores were higher in mathematics and science and lower in reading, language, and spelling relative to their native-English-speaking peers. He argues that the greater language demands inherent in the reading tests accounted for the discrepancy in scores across domains (Garcia, McKoon, & August, 2006). Abedi then concludes that "language factors may be a source of construct-irrelevant variance in standardized achievement tests, affecting the construct validity of the tests themselves" (p. 232 as cited in Garcia, McKoon, & August, 2006, p. 609).

Unless the test is specifically normed with a sample of similar ELL children who are growing up in a bilingual context, it is less accurate and valid for ELLs who have been judged sufficiently fluent in English to be assessed in English. Unfortunately, information on the specific demographic composition of the normative sample used to develop a given measure may not be in the published assessment manuals, but many normative samples have a smaller than expected representation of young children from low-income and culturally or linguistically diverse population subgroups, as compared with the composition of the total population of young children. If the normative sample for a given measure does not match the demographic characteristics of those children who are being assessed, then the resulting norms may not be appropriate for use with such a group of children.

Advances in Assessments for Young ELL Children

In view of the challenges associated with assessing language dominance, Fred Genesee and colleagues (2004) have recommended that educators ask the parents/family members about the child's earliest language exposure to determine language dominance. Research indicates that the amount of input, frequency of use, and the parents' estimates of language ability highly relate to the level of proficiency in the language (Gutiérrez-Clellen & Kreiter, 2003). One example of a parent report measure of children's English vocabulary development is the MacArthur Communicative Development Inventory (CDI) (Fenson, Pethick, Renda, Dale, & Reznick, 1998). The English version has shown good concurrent validity with other direct measures of English vocabulary (Dale, 1991; Feldman et al., 2000). The CDI has also shown very good reliability and predictive validity with other English-speaking cultures (Reese & Read, 2000). The Spanish-language version of the CDI, the MacArthur Inventario del Desarrollo de Habilidades Comunicativas: Palabras y Enunciados (IDHC) (Jackson-Maldonado et al., 2003) has been adapted and validated for Spanish-speaking children from Mexico.

ELL children will show uneven progress between the two languages, depending on the language tasks. The most frequent method is to assess each language separately then combine scores from both languages to derive one summary score that represents the child's overall bilingual competence (Gutiérrez-Clellen, 1999; Winsler, Diaz, Espinosa, & Rodriguez, 1999). An example of a test that has been designed to assess both Spanish and English proficiency is the Woodcock-Muñoz Language Survey (WMLS). The WMLS was developed as a test of language proficiency for ELL children (Woodcock & Muñoz-Sandoval, 1993). It is a picture vocabulary test that measures the child's ability to name pictured objects. The English and Spanish scores can be combined to obtain a total vocabulary score, for example, a child who can name both "dog" and "perro" is awarded only one point.

While there are some standardized language fluency instruments commercially available for ELL children who speak Spanish, there are very few for children whose home language is neither Spanish nor English. For these children, it is still recommended that they be assessed in both their home language and English. ELLs may show greater initial progress in the home language and limited progress in the second language. Moreover, when the child's achievements are examined in the home language, teachers can also make fairly accurate predictions about the child's potential for learning in the second language (Gutiérrez-Clellen, 1999). If the ELL child is able to learn age-appropriate concepts in the home language, it is probable he will be able to transfer this knowledge to English-language learning.

Informal, indirect methods of observing ELL children's interactions and language usage can provide important information on the child's level of language proficiency. Research has shown that teachers can be highly reliable in estimating a child's level of proficiency and English usage based on their observations of the child (Gutiérrez-Clellen & Kreiter, 2003). Observations and insights from other staff who speak the child's home language and have contact with the child, such as bus drivers and family or health specialists, also can be collected through the use of standardized forms (Gutiérrez-Clellen, 2002; Espinosa, 2006).

In addition to information from parents, staff, and teachers, language proficiency can be assessed directly by asking children to provide spontaneous narrative samples, or story retellings. ELL children's retellings can provide information about their ability to produce and comprehend a language(s). The Renfrew Bus Story (Cowley & Glasgow, 1997) is one example of a standardized language assessment using story retelling. Adults can model a statement about each picture (e.g., "This is John and his frog"; "One day they went to the park") and then ask the child to retell the story. Through this approach, it is possible to determine if the child has sufficient mastery of the target language to comprehend the parts of the story and use complete sentences to retell it. However, this particular instrument (Renfrew Bus Story) should not be used for identifying ELL children with a specific language impairment because it has been shown to overidentify typically developing children, particularly ELL children (Pankratz, Plante, Vance, & Insalaco, 2007).

Carole Hammer and Adele Miccio from Penn State University are developing home language and literacy tools as part of the Bilingual Preschoolers: Precursors to Literacy project that is one component of the Development of Literacy in Spanish Speakers (DeLSS) initiative that is sponsored by the National Institute of Child Health and Human Development (NICHD) and the Institute of Education Sciences (IES). More detailed information of the specific projects, research questions, and preliminary findings can be found on the Centre for Applied Linguistics (CAL, 2007) website (<http://www.cal.org/delss/resources/measures.html>).

A useful compendium of standardized assessment instruments for children aged 3–5 that have English and Spanish versions is in the final stages of completion (Barrueco, Lopez, Ong, & Lozano, 2007). It provides detailed information about the 18 direct child assessment measures that met their inclusion criteria, that is, available in English and Spanish, appropriate for 3–5 year olds, and include language and literacy domains. The psychometric characteristics as well as the cultural and linguistic strengths/weaknesses are carefully described. Of note is the small number of measures that met their criteria for inclusion (18 out of 150). Of the 150 measures identified that were appropriate for the 3–5 age range and assessed development in language, literacy, or English language, only 36 had been used with young ELL children and only 18 of those met all the final inclusion criteria: available in English and another language; direct child assessment; appropriate for the general child population and not just primarily for children with disabilities; standardized in the last decade; and administered by teachers, and examiners or researchers, or both (p. 6).

Conclusion

Teachers, administrators, and researchers who work with young children in early education settings today urgently need to develop effective instructional and assessment approaches that work for all for young children from linguistically and culturally diverse backgrounds. They need to know how best to assess the abilities and learning needs of young children from non-English-speaking and culturally diverse homes. Accurate assessments that include information on the child's home-language fluency as well as stage of English acquisition are critical to the educational decision-making process. Early childhood professionals at all levels will need to understand the linguistic, cultural, economical, and social diversity within the ELL population.

Current assessment strategies, instruments and procedures have many psychometric and practical limitations for young ELL populations. However, the assessment measures and procedures described above can be carefully utilized to gain a better understanding of the language development of ELL children, even as we wait for the continued development of newer and better ELL assessment measures and measurement strategies. Based on this review, several immediate recommendations can be proposed. To more accurately capture young ELL children's language capacity, assessors should

- use multiple measures which may include standardized tests and curriculum-embedded assessments in addition to narrative language samples and observation of children's language usage in natural settings,
- use vocabulary test scores with great caution,
- thoroughly review all psychometric/standardization information provided for any standardized test under consideration and whenever possible only administer those that have been standardized/normed with samples that are similar to the children to be assessed,
- assess each ELL child in both the home language and English over time,
- include the family as important informants on the assessment team, and
- provide intensive and sustained professional development to all early childhood professionals on effective instructional and assessment strategies for children from diverse backgrounds.

In addition, it is important to comprehensively assess each ELL child's development in other domains such as social-emotional functioning, early mathematics, motor development, general knowledge, and conceptual understandings. Many ELL children may be highly competent in areas that are difficult to assess like social-emotional functioning. Young ELL children may also have capacities and abilities that are masked by current testing policies which underestimate their knowledge and potential.

Attention, Noticing, and Awareness in Second Language Acquisition

RONALD P. LEOW

Introduction

The role attention plays in the learning process has almost always been assumed since the earliest studies in the field of second language acquisition (SLA). Any exposure, be it aural or written, manipulated or authentic, to the foreign or second language (L2) is arguably premised on the role of attention on the part of the learner. The SLA field up to the mid-1990s had generally assumed that experimental conditions (instruction or exposure, be it explicit, that is, with awareness, or implicit, that is, without awareness) elicited the required attention paid to the targeted item(s) in the L2 input. This premise is evidenced in the type of research design employed in the studies, which was the classical pretest—experimental condition—posttest design, without any concurrent or online data on learners' actual attention paid to the targeted items in the input.

The early postulations of Schmidt (1990, 1993) and Robinson (1995a) in SLA and Tomlin and Villa (1994) from the field of cognitive science regarding the roles of attention and awareness in input processing arguably propelled several researchers to probe deeper, both methodologically and empirically, into the constructs of attention and awareness. As Schmidt (2001) pointed out, it is quite challenging to separate these two constructs given that in psychology they are commonly viewed as being intrinsically integrated. While the role attention plays is relatively non-controversial in most research fields that include cognitive psychology, cognitive science, and SLA, whether awareness plays a role in learning remains highly debated in all these fields.

This entry presents a concise review of the important tenets of the several major theoretical approaches that have postulated roles for both the constructs of attention and awareness in L2 learning at the initial stage of language processing (e.g., Schmidt, 1990, 1993, 2001; Tomlin & Villa, 1994; Robinson, 1995a). A report of empirical studies premised on some role for attention/noticing are presented followed by those that have isolated the construct of awareness to investigate its effects on L2 learning. Finally, the few current studies in SLA that have empirically probed deeper into the construct of unawareness will be reported.

Theoretical Approaches to the Roles of Attention and Awareness in SLA

While there are several theoretical underpinnings in the SLA field that have postulated an important role for attention at the initial stage of L2 development, only Schmidt's (1990 and elsewhere) noticing hypothesis, Tomlin and Villa's (1994) functional model of input processing in SLA, and Robinson's (1995a) model of the relationship between attention and memory have directly addressed the roles of both attention and awareness. The main tenets of these three approaches are discussed below.

Schmidt's Noticing Hypothesis

Drawing from works in cognitive psychology and his own personal experience while learning Portuguese, Schmidt's (1990, and elsewhere) noticing hypothesis postulates that attention, which "is necessary in order to understand virtually every aspect of second language acquisition" (Schmidt, 2001, p. 3), controls access to awareness and is responsible for noticing. Noticing is "the necessary and sufficient condition for the conversion of input into intake" (Schmidt, 1993, p. 209). Intake in SLA is usually defined as a subset of the input that has been taken in by the learner but not necessarily internalized in the language system and occurs at a preliminary stage along the acquisitional process (e.g., Leow, 1993). Attention, according to Schmidt, is isomorphic with awareness and he rejects the idea of learning without awareness. In addition, Schmidt proposes a level of awareness that is higher than awareness at the level of noticing, namely, awareness at the level of understanding. Whereas awareness at the level of noticing leads to mere intake, this higher level of awareness promotes deeper learning marked by restructuring and system learning and is underscored by learners' ability to analyze, compare, and test hypotheses at this level.

Tomlin and Villa's Functional Model of Input Processing in SLA

While concurring with Schmidt's noticing hypothesis on the important role of attention in learning, Tomlin and Villa's (1994) model of input processing in SLA differs sharply from Schmidt's regarding the role of awareness in the acquisitional process. Drawing on works in cognitive science, Tomlin and Villa (1994) propose a functionally based, fine-grained analysis of attention. In their model, attention comprises "three separable attentional functions that have also been paired to separate yet interconnected neuroanatomical areas" (Tomlin & Villa, 1994, p. 190): (a) alertness (an overall readiness to deal with incoming stimuli), (b) orientation (the direction of attentional resources to a certain type of stimuli), and (c) detection (the cognitive registration of stimuli). The network hypothesized to be necessary for further processing of input and subsequent learning to take place is that of detection. The other two networks (alertness and orientation) are important in SLA and can enhance the chances that detection will occur, but their role in promoting detection is not crucial. According to Tomlin and Villa, in their model, detection does *not* imply awareness, that is, awareness does not play a crucial role in the preliminary processing of input during exposure.

Robinson's Model of the Relationship Between Attention and Memory

Robinson's (1995a) model of the relationship between attention and memory neatly reconciles Schmidt's notion of noticing (which involves awareness) and Tomlin and Villa's notion of detection (which does not imply awareness). In this model, detection is strategically placed at an earlier stage in the acquisitional process when compared to noticing. In other words, linguistic information may be detected and taken in by the learner but if this information is not accompanied by awareness, then the chance of this information being further processed is relatively minimal. Noticing, according to Robinson, is "detection plus rehearsal in short-term memory, prior to encoding in long-term memory" (Robinson, 1995a, p. 296). Like Schmidt, Robinson assumes that noticing does involve awareness and that it plays an important role in L2 learning.

As can be seen from the tenets of the different theoretical approaches to the roles of attention and awareness in SLA, the facilitative role of attention in L2 development is generally accepted while the role of awareness is not without debate. More specifically, while both Schmidt's noticing hypothesis and Robinson's model posit a crucial role for awareness, Tomlin and Villa's model does not. What is not controversial, then, is that

attentional resources do need to be allocated to specific linguistic (grammatical, lexical, phonological, etc.) information in the input. However, whether these attentional resources need to be accompanied by learner awareness to process the linguistic information in the input for intake and subsequent learning remains debatable in the SLA literature.

Attention/Noticing and Learning: Empirical Evidence in SLA

There are several strands of SLA research that are explicitly or implicitly premised on the role(s) of attention, or noticing (attention plus a low level of awareness), or both, in L2 development. These strands include processing instruction, interaction or feedback, learning conditions, input/textual enhancement, focus on form, and so on. Attention/noticing has been measured by a variety of instruments in SLA studies that include offline questionnaires, online uptake charts, learning diaries, online verbal reports, and offline verbal reports such as stimulated recall protocols. In addition, in some studies students were prompted to take notes while reading an L2 text, to underline, circle, or check targeted linguistic structures in written text, or to make a check mark every time a targeted item is heard.

Quite a large range of linguistic items has also been empirically investigated and these include Spanish imperatives, imperfect and preterit forms, present perfect forms, relative pronouns, past conditional; Finnish locative suffixes; English possessive determiners, relative clauses; French past participle agreement, and so on. Different levels of language experience have also been explored, ranging from beginner learners of an L2 to intermediate to advanced levels. Amount of exposure is also differential, ranging from less than an hour to over several days.

Overall, the findings of these studies provide strong support for the role of attention, or noticing, or both, in L2 development. However, the research designs of many of these studies did not methodologically tease out the specific role awareness played while learners were attending to incoming L2 data. To this end, the next section reports on the definition and operationalization of the construct of learner awareness and empirical studies that methodologically addressed the role of this construct in L2 development.

Awareness and Learning in SLA

Awareness is defined in SLA as “a particular state of mind in which an individual has undergone a specific subjective experience of some cognitive content or external stimulus” (Tomlin & Villa, 1994, p. 193). Awareness, according to Leow (2001), may be demonstrated through (a) some resulting behavioral or cognitive change, (b) a meta-report of the experience but without any metalinguistic description of a targeted underlying rule, or (c) a metalinguistic description of a targeted underlying rule. In addition, the operationalization and measurement of what constitutes awareness in SLA is methodologically thorny and varied. Leow, Johnson, and Zárate-Sánchez (in press) provide a methodological review of relevant studies in both SLA and non-SLA fields and call for a finer-grained approach to the study of the construct of awareness. This finer-grained approach advocates, in any report on the role of awareness in L2 development careful consideration of several aspects of the research design that include (a) where awareness is measured (at the stage of encoding that is online versus at the stage of retrieval that is offline), (b) what kind of item is being targeted, and (c) how awareness is measured (the measurement instrument).

Whether awareness plays a role during attention to or processing of incoming L2 data has led to a growing debate in SLA. Several researchers have supported a dissociation between learning and awareness in SLA (e.g., Tomlin & Villa, 1994; Williams, 2004, 2005)

while others have rejected this dissociation (Schmidt, 1990, and elsewhere; Robinson, 1995a; Leow, 2000; Hama & Leow, 2010).

Studies addressing the role of awareness in L2 development can be categorized into two methodological approaches, namely, awareness was measured either concurrently or online (e.g., Rosa & O'Neill, 1999; Leow, 2000, 2001; Rosa & Leow, 2004; Martínez-Fernández, 2008; Hama & Leow, 2010) or non-concurrently or offline (e.g., Robinson, 1995b; Williams, 2004, 2005). Concurrent measures of awareness in SLA occur at the stage of encoding or construction, that is, *while* learners are processing the incoming data, and include think aloud protocols or verbal reports. Non-concurrent measures, on the other hand, occur at the stage of retrieval or reconstruction, that is, *after* the data have been processed, and they include questionnaires, offline verbal reports, or oral interviews. Currently, there is some methodological debate regarding the validity of concurrent verbal reports given the potential reactive nature of this measurement. While most of the studies addressing this issue do not report any significant change in learners' processing due to thinking aloud during task performance when compared to a non-think aloud control group, the issue still warrants further empirical exploration. Similarly, non-concurrent measures such as offline verbal reports, oral interviews, or stimulated recasts run the risk of veridicality or memory decay (Leow, 2000; Egi, 2008), that is, the reports provided may not reflect the actual process employed during the initial exposure at the encoding stage.

Empirical Evidence for the Role of Awareness in SLA

Overall, many of the studies that have independently investigated the construct of awareness by employing online verbal reports to operationalize and measure this construct appear to provide empirical support for the facilitative effects of awareness on foreign-language behavior and learning. Several levels of awareness have also been reported that include, for grammatical items, awareness at the levels of noticing and understanding (Rosa & O'Neill, 1999; Leow, 2001; Rosa & Leow, 2004) and an intermediate level of awareness between the levels of noticing and understanding, namely, awareness at the level of reporting (Leow, 2001). For lexical items, Martínez-Fernández (2008) reported two levels: "noticing of one word aspect" (either the word form or the meaning) and "noticing of two word aspects" (i.e., both word form and the meaning). In addition, higher levels of awareness appear to correspond with both higher levels of intake and learning and the presence of hypothesis testing and rule formation, providing empirical evidence for Schmidt's two levels of awareness postulated in his noticing hypothesis.

To date, however, only a very limited number of published SLA studies has directly examined whether language development can occur among *unaware* learners (Leow, 2000; Williams, 2004, 2005; Hama & Leow, 2010). The paucity of studies on this issue in SLA is relatively alarming given that many so-called learning conditions designed to promote either implicit or explicit learning have not gathered empirical evidence that first established the presence of such processing taking place in the experimental conditions before statistically analyzing the effects of type of learning condition on L2 development. The performance on a post-condition task is usually assumed to be based on knowledge gleaned from either explicit (with awareness) or implicit (without awareness) processing of the linguistic information embedded in the experimental input. This assumption has been challenged by several studies (e.g., Rosa & O'Neill, 1999; Leow, 2000, 2001; Rosa & Leow, 2004) that have gathered concurrent data while learners were processing the experimental input. These studies reported that, notwithstanding the experimental condition, some participants did not represent the condition under which they were placed. To this end, the studies on unaware learners are closely examined in the next section.

Learning Without Awareness?

There are currently four published studies that have investigated the performances of learners who have been coded as being unaware of the underlying grammatical rule while exposed to the experimental input (Leow, 2000; Williams, 2004, 2005; Hama & Leow, 2010). Leow (2000) employed a hybrid design that employs both qualitative (based on online think aloud protocols data) and quantitative (based on offline procedures data) analyses. His study addressed the effect of awareness or lack thereof on 32 adult English-speaking L2 learners' subsequent intake and production of L2 forms (third persons of Spanish irregular preterit verbs ending in either *-er* or *-ir* that have a stem change in this tense). His experimental task was a problem-solving one (a crossword puzzle). He reported that learning did not appear to occur among unaware learners.

Williams (2005) reported that unaware learners can provide evidence of learning without awareness. Following up on his 2004 study with methodological improvements, Williams conducted two experiments to test whether participants were able to learn miniature noun class systems without awareness. The 41 participants in his studies were from a variety of language and linguistics-related backgrounds. The noun phrases used for Williams's experiments were four novel determiners, *gi*, *ro*, *ul*, *ne*. *Gi* and *ro* are the English translation equivalence of 'near', and *ul* and *ne* are equivalent to 'far'. These determiners also carry animacy values: *gi* and *ul* are animate and *ro* and *ne* are inanimate. The results revealed that many of the participants who were classified as unaware were able to choose the correct noun phrase during the assessment task at a significantly above-chance level.

The conflicting results reported in the two studies are not surprising given the several differences between Leow's and Williams's studies. These differences include learning measures (a four-option multiple-choice (MC) recognition assessment task versus a two-option MC assessment task), coding of awareness (at the level of noticing versus at the level of understanding), and stage of awareness measurement (the encoding and retrieval stages versus only the retrieval stage).

Hama and Leow (2010) revisited Williams (2005) by employing a hybrid design to gather data at the concurrent stage of encoding, during the testing phase, and after the experimental exposure (retrieval stage). In addition, the study methodologically extended Williams's research design to probe deeper into learners' processes by (a) increasing the number of items (four instead of two) on his MC test to include the presence of distance in learners' selection of options (i.e., animacy *plus* distance) in order to replicate the training context, (b) including a production test in addition to the MC test, and (c) providing the same modality for both the learning and testing phases.

The quantitative analyses revealed that, at the encoding or construction stage, unaware learners do not appear capable of selecting or producing the correct determiner-noun combination when required to do so from options that include both animacy and distance information. This may be due to the type of research methodology employed, the level of cognitive effort required to process the information at a sentential level when compared to a form or noun phrase level, prior knowledge of a foreign language (in Williams's study this variable was correlated with learning effects), the mode in which the assessment prompts were provided, or all of these. The qualitative data underscore the importance of measuring the construct of unawareness from different sources, that is, both online and offline, given that processes demonstrated during different phases of exposure to the input may not be fully reported at the non-concurrent stage of retrieval of such awareness.

As can be seen, preliminary studies in SLA that have investigated unaware learners reveal contradictory findings similar to those reported in cognitive psychology. While the research indicates quite clearly that the presence of awareness (and its corresponding levels) does appear to have a facilitative effect on intake and learning, more research on

the construct of unawareness is clearly needed to address whether learning can indeed take place in an unaware condition.

Conclusion

This entry has presented a concise overview of the theoretical, methodological, and empirical issues surrounding the roles of attention, noticing, and awareness in adult L2 behavior and learning and provided brief reports of empirical studies premised on these roles in L2 development. The overall findings appear to indicate facilitative effects of attention/noticing and awareness on adult L2 learners' subsequent processing, intake, and learning of targeted L2 forms or structures embedded in the L2 data. At the same time, notwithstanding the methodological concerns inherent in both the operationalization and measurement of the slippery construct of awareness, further research on unaware learning is warranted given the central role awareness plays in many major strands of SLA research. While current research findings are indeed promising, more robust research designs are clearly needed to address the issue of L2 development premised on the roles of attention/noticing and (un)awareness given the wide variety of variables that can potentially impact learners' processes while interacting with L2 data. Such findings can only improve our understanding of the attentional and cognitive processes involved in L2 learning.

Attitudes and Motivation in Bilingual Education

DAVID LASAGABASTER

Introduction

Languages play a paramount role in any society in general and in education in particular. A student enrolled in a bilingual school in which different languages are in contact soon realizes that society, family, peers, and school all place importance on these languages. The students' own assessment, together with the context, the information, and the knowledge they acquire will shape their attitudes toward these languages and their motivation for learning them.

Research into attitudes and motivation flourished in the 1950s and, since then, all the major theories and models of second language acquisition have underscored their importance. It has become clear that attitudes affect motivation, and the interrelationship between these two concepts has been widely acknowledged in literature on the subject.

Attitudes

The popularity of the concept of attitude is confirmed by its use in many diverse fields of research: education, sociology, sociolinguistics, social psychology, and political science, to name but a few. Although from an etymological point of view attitude was originally a technical term in art for the posture of a figure in a statue or painting, its current psychological meaning has imposed over the physical one. Among the many available definitions, Ajzen's (1988, p. 4) is probably the most widely quoted one due to its brevity and clarity: "a disposition to respond favourably or unfavourably to an object, person, institution or event."

Attitudes are not innate but rather acquired and can be learned, and through learning they change and evolve. Attitudes are mainly social and we acquire them through direct or indirect social interaction, which is why the social context plays such a significant role in their analysis. Attitudes are determined by such influential factors as the family, work, religion, mass media, friends, or education, to the extent that individuals tend to adjust their attitudes so that they match those of their social group. So the origins of our attitudes and changes in them can be affected by different agents, and among these institutions are powerful influences. Every individual develops in a social context where institutions are very present, and nowadays most people spend a large part of their lives in education-related institutions.

Motivation

Motivation is a complex psychological construct that acts as a direct determinant of second language (L2) achievement, which is why much attention has been paid to this individual variable in second language acquisition literature. Gardner (1985, p. 10) defines motivation

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

© 2013 Blackwell Publishing Ltd. Published 2013 by Blackwell Publishing Ltd.

DOI: 10.1002/9781405198431.wbeal0059

as “the extent to which the individual works or strives to learn the language because of a desire to do so and the satisfaction experienced in this activity.”

Although the factors that may account for individual differences in L2 learning are as manifold as there are people, motivation—forgive the truism—is crucial, especially in classroom language learning. Studies carried out in many different contexts have demonstrated that there is a clear correlation between motivation and language achievement.

For decades motivation was regarded as a relatively stable learner trait, but from the 1990s onwards research on motivation has undergone a shift toward a more dynamic construct. Although language learners are usually highly motivated when they set out to learn a foreign language, the challenge lies in maintaining that motivation. Yet the dynamic character and temporal variation inherent to students’ motivation have been somewhat neglected in studies so far. The mastery of an L2 is a long process which usually takes several years and in which students’ motivation fluctuates. Research is also currently more grounded in the context where the learning takes place.

Different Motivational Models

The different models of second language acquisition have traditionally highlighted the importance of attitudes and motivation. Due to space constraints, reference will be made to only three bilingual-education-friendly models: Lambert’s (1974) model of second language learning, Gardner’s (1985) socioeducational model of second language acquisition, and Dörnyei’s (2005) L2 motivational self system.

In Lambert’s model—the precursor of all others—an individual’s aptitude (the inherent ability to learn) and attitudes toward a language are regarded as two major factors which bear on motivation, that is, the readiness to engage in language learning or language activity. These three ingredients (aptitude, attitudes, and motivation) contribute to a learner’s bilingual proficiency, which results in higher or lower self-esteem and one’s self-concept. This model provides two alternative results as a consequence of the interaction of the previous factors, namely additive (the L2 does not entail any risk to the first language or L1) or subtractive (the L2 replaces or demotes the L1) bilingualism.

Gardner’s model has been thoroughly researched and tested. It is divided in four stages, with the individual’s social and cultural background (including the home, neighbors, friends, and the wider community) representing its base. The second stage includes four individual variables that will affect language learning: language aptitude, intelligence, motivation or attitudes, and situational anxiety. The third stage distinguishes between the formal and informal language-learning environments and, finally, the fourth stage has to do with the linguistic (bilingual proficiency) and non linguistic (attitudes or cultural values) outcomes. A learner’s attitudes can change and are conceived as having both a triggering and a product role, as this is a cyclical—not static—model in which attitudes and motivation can be both a cause and an effect. According to Gardner, motivation involves “the combination of effort plus desire to achieve the goal of language learning plus favourable attitudes towards learning the language” (1985, p. 11). One of the main results of Gardner’s and his associates’ work was the development of the “Attitude/Motivation Test Battery,” a standardised test which encompasses the different components of Gardner’s theory of L2 motivation.

Gardner claims that the reasons for learning a second language show two main orientations. The first one is known as integrative orientation, a term coined by Lambert which indicates “a sincere and personal interest in the people and culture represented by the other group” (quoted in Gardner, 1985, p. 133). The second orientation is instrumental, learning the language for pragmatic or useful purposes such as economic advantages or better job prospects and promotion. These orientations are independent of intelligence and

aptitude. Gardner objects to the misinterpretation of his theory as a dichotomy of integrative and instrumental orientation, as this dichotomy is only at the orientation level and is not part of the core motivation component.

Nevertheless, Oxford and Shearin (1994) indicate that there may be other reasons for second-language learning, such as intellectual stimulation or cultural curiosity. They also argue that a distinction should be made between foreign-language learning and second-language learning. The language-learning context and the complexity of the identities of second-language learners vary a great deal in different contexts and, subsequently, the role of integrativeness has been challenged. In bilingual-education programs where a regional language is included the integrative motivation may exert a greater influence on language proficiency, whereas in bilingual programs in English as a foreign language instrumental motives may play a more central role in the learning of English as L2.

The distinction between the integrative and the instrumental orientation is often hard to define. An integrative motive may have instrumental strands or components, making this dichotomy oversimplistic. This is acknowledged in Dörnyei's model, which redefines these motives in terms of perceptions of the self and the ideal self.

Dörnyei's L2 motivational self system, albeit firmly rooted in L2 research, stems from psychological theories of the self and consists of three components (Dörnyei, 2005, p. 106):

1. Ideal L2 self: If the person we would like to become speaks an L2, the ideal L2 self becomes a powerful motivator to learn the L2. This component encompasses the traditional integrative and internalized instrumental motives.
2. Ought-to L2 self: This component refers to the attributes one believes one ought to possess (i.e., various duties, obligations, or responsibilities) in order to avoid possible negative outcomes. It includes the most extrinsic (i.e., less internalized) types of instrumental motives.
3. L2 learning experience: The last component concerns situation-specific motives related to the immediate learning environment and experience (i.e., the influence of the curriculum, the teacher, the peer group, and the experience of success or failure).

In this model, motivation would involve the desire to find harmony between one's current self and the ideal or ought self by reducing discrepancy between our actual and ideal selves. Since young learners cannot consider multiple perspectives of the self, this approach is considered to be appropriate from adolescence onward. It is worth pointing out that this model does not invalidate previous results in the field of L2 motivation research, but rather helps to reframe them.

These three models are not contradictory and their predictions are consistent with each other's.

Minority Languages

The social position of a few minority languages the world over has undergone an enormous change in the last few decades, a period in which, after a mammoth fight to recover their rights, speakers have managed to regain the social representation denied to them for many years. School has thus become one of the main social spaces where minority languages are again taken into account and are playing an active role in preparing the next generation of students. However, the language attitudes held by majority and minority groups have a direct impact on language policy for the minority language.

The importance of institutions' commitment to bilingual education and the latter's impact on language attitudes and motivation is clearly reflected in the case of Basque, a language spoken in two autonomous communities in the north of Spain (Basque Autonomous

Community—henceforth BAC—and Navarre) and the south of France (Northern Basque Country, henceforth NBC). There are important differences between the three regions into which the Basque-speaking community is split and which influence Basque's position in the education system of each of them: Basque is fully co-official with Spanish throughout the BAC, it is fully co-official only in the north of Navarre (it has no official status in the center and south), whereas in the NBC only French is identified legally as the official language.

There are remarkable differences between the regions regarding how much support is given to Basque (Basque Government, 2008). Analysis of the 1996–2006 decade shows that the BAC government's efforts to normalize the situation of Basque have led to a substantial change in the attitudes of the population. In this normalization process the set of rules governing the balanced use of both Basque and Spanish had been previously established, including the implementation of bilingual programs at schools. As a result of this, there was an enviable rise of 18.7% (from 46% to 64.7%) among those positively disposed, especially among the youngest age group (below 25) due to the positive impact of the bilingual programs available. The situation in the NBC is just the opposite, as the 7.8% decrease in positive attitudes (from 49% to 41.2%) is accompanied by a 4.6% increase in negative attitudes. In Navarre, the situation appears to have almost stabilized. Just over 2.2% of Navarrese are now more opposed to these promotion efforts than in 1996, whereas those who support them have slightly decreased (0.3%, from 38% to 37.7%). Although support for efforts to promote Basque is still 3.5% higher in the NBC than in Navarre, the drop in positive attitudes over 10 years in the NBC is sharp.

The Basque case clearly demonstrates how important the combination of speakers' and institutions' efforts is not only to maintain, but also to revive and, above all, normalize a minority language. Regarding bilingual education, the conclusion to be drawn is that, if the regional language has high status in the eyes of the students, they will be more motivated to learn it and will harbor more favorable attitudes. Therefore, the political dimension comes to the fore and the psychological merges with the political, so that attitudes become part of a multilayered and dynamic scenario related to identity construction and language ideologies which has individual, group, and societal dimensions. Nowadays there is no doubt that the political dimension of language motivation has to be considered.

Foreign Languages

Education departments the world over are attaching increasing importance to the implementation of bilingual programs in foreign languages, since there is a widespread desire to educate multilingual and multicultural citizens in a context where the linguistic consequences of globalization are more and more evident. Consequently, an ever-increasing number of schools and universities are offering courses taught in foreign languages, exposing students to teaching through the medium of a foreign language. Since World War II, a global trend has seen English gain importance and replace other foreign languages. In most parts of the world when bilingual education includes the English language, there is generally a consensus support for bilingual education—this is not always the case if the language concerned is a minority language.

Lamb (2003) points out that the spread of English has a direct effect on integrative motivation as it may be more important in English as a Second Language (ESL) contexts like Canada than in many other English as a Foreign Language (EFL) contexts around the world: The contact with L2 speakers and their culture in EFL settings may be more limited and its relevance with younger learners is doubtful. Thus, if our understanding of integrative motivation changes, "we may need to change teaching methods and materials too" (Lamb, 2003, p. 17).

Moreover, many fear that this hegemony of English will make people lazy about learning other languages or simply make all the other languages unnecessary; it may also hasten the disappearance of minority languages and could cause widespread language death. The study carried out by Dörnyei, Csizér, and Németh (2006) highlights this. These authors examined motivation and language attitudes among 13,000 teenage language learners on three successive occasions (1993, 1999, and 2004). The objective was to describe the impact of sociopolitical changes on the various language attitudes prevailing among Hungarian students and their motivation to learn five foreign languages: English, German, Italian, French, and Russian. The authors state that, despite having a small country as their target, the results are not confined to Hungary but have worldwide implications, as their data can provide valuable information into the actual operation of language globalization.

There was a consistent rank order of the five target languages in the three survey phases, in which English always appeared at the top and Russian at the bottom of the participants' preferences. However, the most outstanding finding was the general decline over time. While English maintained its high educational profile, the remaining languages became less and less appreciated. The authors conclude that the learning of languages other than English is impeded by what they label as the "Englishization" process.

Conclusions

The multifaceted nature of attitudes and motivation has precluded the different theories from representing and tackling them in their total complexity. Many questions have been raised by researchers and educators about their role in second-language education, and, in this brief overview, there are several important issues that have not been tackled: the relationship between these concepts and different variables such as gender, the need for greater interdisciplinarity in their study, the need to combine quantitative (self-report surveys still reign supreme) and qualitative approaches in research, the recent trend to analyze attitudes to multilingualism, or the need to track changes over time. Attitudes and motivation are not static and they therefore vary due to the influence of people, learning experiences, and the different contexts.

The study of different language-teaching types of provision and the tasks undertaken presents itself as a potentially very promising field of research regarding the development of motivation. By focusing on different approaches, the researcher can probe their diverse effects and this will certainly be of teachers' interest in bilingual contexts, as the presence of different linguistic models is usually the norm. Similarly, the burgeoning presence of bilingual programs in the current *lingua franca*, English, demands motivational studies focused on the characteristics of the manifold and different contexts where they are being implemented (Lasagabaster & Ruiz de Zarobe, 2010).

If education authorities intend to implement coherent language policies, it is necessary to know how the different languages in contact are used in the diverse social contexts and how their functions are being extended or restricted. In order to understand this question, we have to know what the linguistic situation of the different languages is, what the existing motivation to learn them is, and which favorable or unfavorable attitudes are held. Although some motivational dispositions appear to be inborn as part of the human condition, high-level dispositions such as motivation to learn are not endowed by birth (Brophy, 2004, p. 17). Therefore, bilingual-education programs have much to say in the development of their dynamic nature.

Attrition and Multilingualism

MONIKA S. SCHMID

Introduction

To think “bilingualism” is usually to think “second language” (L2). Virtually all research that is conducted on multilinguals focuses on the way in which they acquire and use the languages which are not their “native” one. Observations gained from that study are then compared to first language (L1) speakers, and attempts are made to pinpoint and explain the differences between the two populations (L1 speakers vs. L2 learners).

The assumption underlying this bias is that once a “native” language has developed to a certain point, it becomes stable and hence uninteresting. Second language learning, on the other hand, is so obviously impacted on by a large number of other factors, such as crosslinguistic influence, age at acquisition, attitude, and motivation, that it is considered a profitable area of research. Bilingual speakers are, in other words, taken to have one language system in which they are identical to monolinguals (their native language) and one which shows influence from that system across all linguistic levels. This view is schematically represented in Figure 1.

On the other hand, there are cases where the presumed stability of the native language apparently can become compromised: speakers who have lived in a migration environment

Figure 1 L1 influence on L2 in SLA (Figure 1 from Schmid & Köpke, 2007, p. 2). Used with kind permission by John Benjamins

Figure 2 L2 influence on L1 in attrition (Figure 2 from Schmid & Köpke, 2007, p. 2).

for a long time can sometimes show signs of “forgetting” their L1. When they attempt to speak it, they may have difficulties in remembering certain words, they may make what appear to be lexical or grammatical “mistakes,” or they may speak their native language with a foreign accent. This is usually ascribed to a scenario where the picture represented above has reversed: for these speakers, it is the second language (the language of the country to which they emigrated, and which they speak in daily life) which has become dominant, and which now influences the native language. Originally, this was the view which was assumed to hold true in first language attrition (see Figure 2).

The view of the first language system as something that is stable and invulnerable is extremely pervasive. One’s “native” or “mother” tongue may be something that is so intimately linked with early development, identity, cultural roots, and so on that any indication that this fundament may be open to change or crosslinguistic influence, and that native speakers may turn into “foreigners,” is often perceived as threatening or shocking. This is evident in the reactions of reproach or even outrage which language attriters are often confronted with. For example, Stolberg and Münch (2010) quote a native speaker of German who had lived in the USA for a long time, and relates how one of her correspondents would minutely go over each letter that she had written, pointing out any “errors” in language use. At some point, her admission that she did not always know how to say certain things in her L1 any more elicited his remonstrance that “One does *not* forget one’s mother tongue!”

Similar responses abound in popular culture. In the fifth volume of Alexander McCall Smith’s *The No. 1 Ladies’ Detective Agency* series (*The Full Cupboard of Life*), the protagonist, Mma Precious Ramotswe, reflects on the case of a fellow native of Botswana who had gone to live abroad as a young man and, upon his return many years later, had been unable to understand and interact in Setswana any longer. To the native Setswana, he appears to

have become a foreigner. This experience deeply shocks Mma Ramotswe, who feels that such a thing is “like forgetting your mother, and as sad” (2003, p. 163). The unforgettable title character of Peter Høeg’s *Miss Smilla’s Feeling for Snow* compares the erosion of her native Greenlandic to stainless steel snaplinks which had been exposed for a few months to the most hostile climate on the planet, the fog of the Arctic Sea, and had corroded to the point that they could be picked apart with a fingernail (1996, p. 105). And a minor character in Stephen King’s *Dead Zone*, who escaped from Warsaw as a boy (and alone), calls the fact that he can no longer speak or understand his native Polish “a shameful thing” (1980, p. 121). These examples illustrate the extent to which the native language is commonly felt to be the incorruptible foundation on which identity is built.

Early investigations of first language attrition consequently assumed that this would be a process that would only occur under the most extreme of circumstances, among speakers who had lived in emigration for a very long time, hardly if ever used their L1, and possibly had particularly strong reasons to reject it and acculturate into their new surroundings (e.g., Andersen, 1982; Waas, 1996). Such speakers would then, almost by definition, be particularly successful second language learners.

However, psycholinguistic investigations of the bilingual mind have contributed toward a change in perception, and shown that within the continuum of bilingual proficiency, both of the representations shown above are idealizations which do not obtain in reality. In the mind-brain of any speaker of more than one language, a linguistic supersystem is created, where all languages are merged to some degree. The representation and integration of linguistic categories—semantic, phonetic, or grammatical—within this system may not entirely correspond to or overlap with the way they are represented in the mind of a monolingual native speaker. For example, Pavlenko (2011) mentions the well-known case of the boundaries and prototypes of color categories which appear to differ for monolingual and bilingual speakers of some languages; and Flege (1987) has shown that some phonemes can take on characteristics of the other language in both of a bilingual’s languages.

These and other findings strongly suggest that “extreme” cases of language attrition, where speakers become perceptibly different from natives, are merely the more noticeable end of the full spectrum of what Cook (e.g., 2003) has termed “multicompetence.” In any such system, even among beginning learners of a foreign language, crosslinguistic traffic can go both ways (see Figure 3).

The Extent of Attrition Effects

Largely anecdotal reports of substantial language attrition—such as the ones quoted above—notwithstanding, corpus-based quantitative investigations of the attritional process have usually found that the actual degree to which the use of a language has changed is surprisingly low—as long as the speaker did not migrate before the age of 12. There is considerable cumulative evidence which suggests that this age is, in fact, a turning point for the development of the first language: among younger speakers, it appears that knowledge of the native language can indeed be lost dramatically or even totally, while post-puberty migrants often perform within the native range on a variety of tasks (for an overview see Köpke & Schmid, 2004, and Schmid, 2009). It has therefore been proposed that the two processes—changes to the first language among children versus adolescents/adults—should be rigorously distinguished: in the former instance, it is more appropriate to speak of *incomplete acquisition*, while the term *attrition* should be reserved for those speakers whose native language acquisition process has been completed prior to migration.

Figure 3 An integrated view of bilingualism (Figure 3 from Schmid & Köpke, 2007, p. 3).
Used with kind permission by John Benjamins

Many investigations of this latter process (attrition of a language which has been completely acquired) seek to answer the question of whether it can eventually come to affect the structure or (to use a somewhat old-fashioned term) competence in a native language, or whether it is merely a matter of use or performance. However, while it was proposed that “it is erosion that reaches the level of competence that allows for interesting claims about and meaningful insights into the attrition process” (Seliger & Vago, 1991, p. 7), among mature speakers there are to date no documented instances of such radical processes of deterioration. It has been shown that attrition is more liable to affect features which are preferential or optional, such as the use of null versus overt pronouns, rather than deterministic grammatical relations (Gürel, 2004; Tsimpli, Sorace, Heycock, & Filiaci, 2004; Tsimpli, 2007).

Truly structural changes, such as an overall reduction of a complex case system where some of the cases would become radically underused or disappear completely have never been observed in an attritional setting. On the other hand, investigations such as the ones by Schmitt (2004, 2010) suggest that for younger migrants whose acquisitional process was not completed prior to the change in linguistic environment, such a wholesale simplification can, in fact, occur: her investigations of L1 speakers of Russian who were four years old (Schmitt, 2004) and 8–10 years old (Schmitt, 2010) at migration show a dramatic reduction in the target-like application of all oblique cases, while the nominative seems relatively unaffected by the erosion process.

Schmid (2009) argues that such findings imply that among mature speakers attrition cannot affect the underlying representation of linguistic knowledge, while for incomplete learners, such a reconstruction is possible. She demonstrates that even the most strongly attrited case in her overall corpus totaling some 140 attriters, an L1 speaker of German who left her native country at the age of 11 and made no use of German for five decades,

still compares favorably with a highly advanced L2 learner of German who speaks it daily on a range of grammatical features as well as with respect to perceived foreign accent.

Psycholinguistic Models of Language Attrition

It therefore seems that the indications of “attrition” that are perceived and remarked on by the attriters themselves and by other speakers of their L1 are usually more linked to problems of (predominantly lexical) access and momentary effects of crosslinguistic influence than to an actual restructuring of the underlying language knowledge. Such effects may be best conceived of and explained within psycholinguistic models, such as Paradis’ activation threshold (AT) hypothesis (Paradis, 2004). This model holds that any memory trace, such as a word, an expression, or a morpheme, has a certain AT associated with it. The higher this threshold, the more effort it takes to recall the item from memory. The AT is determined by frequency and recency: items that have been very frequently called upon have a low threshold, but if the item is not activated for a long time, the threshold will gradually rise.

Based on this hypothesis, Paradis (2007, p. 121) predicts that it is the disuse of a language which will lead to gradual language loss. This prediction is probably the most intuitively and immediately obvious assumption with respect to language attrition. If two migrants who had left their home country at a similar age and lived in migration for a similar length of time show differences with respect to the degree of erosion and L2 influence that is perceptible in their L1, most people will likely assume that they have had different opportunities to use and “practice” their language skills.

Rather surprisingly, however, such a straightforward correlation between “amount of L1 use” and “degree of L1 attrition” appears to be extremely difficult to establish in actual attrition settings. A number of large-scale quantitative investigations have attempted to determine a link between L1 use in a variety of contexts (interactive exposure, passive exposure such as books and TV, inner speech) and attriters’ performance on a number of different tasks and for different populations (Schmid, 2007; Schmid & Dusseldorp, 2010; van der Kooi, 2010; Yilmaz, 2010). These analyses, however, did not yield the expected results: Schmid (2007), for example, finds no impact of the frequency of use of L1 within the family or with friends on any of the linguistic variables of lexical diversity and fluency in free speech which she has measured. The only L1 use setting which has some impact is the use of the L1 for professional purposes. Similar results are found in a number of other ongoing investigations, for example a study of the bilingual development of Moroccan and Turkish speakers in the Netherlands (van der Kooi, 2010; Yilmaz, 2010). Again, the use of the L1 in informal settings plays no role for the task these studies have conducted (a picture naming task), and it is only the use of the L1 at work which is associated with quicker naming times and higher accuracy.

Schmid (2007) therefore speculates that for a mature native speaker who has lived in his or her native environment until puberty, the first language knowledge might have been rehearsed to the point where frequent reactivation is no longer necessary to prevent deterioration. She proposes that in such a case it may be that the problems which attriters can experience are due not so much to the fact that their L1 knowledge has become inaccessible due to a high AT, but to the increase in competition from the second language. In other words, it is not so much that attriters “forget” their L1, but that the competing L2 has become too strong to be entirely inhibited.

This explanation hinges on the fact that, in order to access a certain item of knowledge, it is not only necessary that there be enough stimulation to overcome the AT: At the same time, all other items of knowledge which may be in competition with the target have to be inhibited in order to ensure that they will not be activated by mistake. For a bilingual

who routinely speaks his or her second language and only infrequently uses the first, this may mean that, while the L1 has not become inaccessible or forgotten, the L2 keeps getting in the way, leading to (voluntary or involuntary) code switches, mistakes, or other signs of crosslinguistic influence.

This explanation can account for the fact that informal use of the L1 (with family and friends), although it is probably the most frequent type of exposure, does apparently not impact on attrition: in this type of situation, all interlocutors are typically bilingual, so that the abovementioned indications of crosslinguistic influence do not impede communication, and little effort needs to be made on inhibiting the L2. On the other hand, speakers who use their L1 for professional purposes (whether as a German language teacher in Canada, as a waiter in a Moroccan restaurant, or as service staff in a Turkish supermarket) often find themselves in situations where code switching may not be considered appropriate. Consequently, they may be more practiced at inhibiting the L2 and keeping it from “butting in” when they want to speak their first language. More routine experience with inhibiting L2 may then account for their better performance on L1 tasks.

The Controversy on the Nature of L2 Knowledge

The findings presented above on the restructuring of the L1 system in incomplete learners versus its preservation among attriters may help shed light on one of the most fundamental and controversial issues in the study of multilingual development: whether there are fundamental, underlying, and qualitative differences between languages learned early and later in life, or whether these differences are gradient and quantitative. This question is usually addressed in the context of the impact of age on language learning.

While younger learners tend to be more successful in some areas of language learning than older ones, the question of whether or not the level of proficiency L2 learners can attain is maturationally constrained as a function of the age at which they start acquiring their L2 is highly contested. Early hypotheses (Penfield & Roberts, 1959; Lenneberg, 1967) assume a strongly biological explanation for the lower levels of L2 proficiency typically witnessed in later learners. An evolutionary advantage is ascribed to restricting highly intensive and cognitively costly learning mechanisms triggered by linguistic input to a certain time window, since no more learning is required once the skill has been acquired and the cognitive resources can be more efficiently deployed for other purposes (e.g., Pinker, 1994). This assumption is corroborated by the finding that computer simulations of human evolution end up with “a critical period for language acquisition, centered in early childhood, as the inevitable outcome” (Pinker, 1994, p. 300).

Other views take a less deterministic stance and assume that the fact that older learners rarely if ever attain native-likeness is not due to the total and highly specific “dismantling” of a certain neurobiological prerequisite for language acquisition but to the fact that these learners have a mature and deeply entrenched L1 system that the L2 has to compete with. Furthermore, it is often proposed that overall cognitive development plays an important role: children acquire their first language entirely implicitly, that is, knowledge-building happens unconsciously based on input which is not cognitively and metalinguistically analyzed. Older learners, however, bring cognitive and analytical strategies to language learning, so that at least some of the acquisition process happens explicitly.

The controversy over the impact of age of acquisition in SLA thus centers on whether there is a *qualitative* or a *quantitative* difference between early and late L2 learners, or between L1 and L2 speakers. This leads to two different and competing views of the knowledge of late-learned second or foreign languages: one which takes residual optionality to be an indication of an underlying representational deficit conditioned by maturationally

constrained limitations to language acquisition, and one which assumes that L2 learners can establish native-like underlying knowledge but fail to apply it consistently, due to the cognitive demands engendered by the competition between the two languages.

These two competing models have important implications for our understanding of the human capacity for language and in particular the degree to which the brain is specialized for language and its acquisition. However, investigations have so far found it difficult to establish conclusively which of the two scenarios applies. The findings from such studies are hardly ever deterministically supportive of one or the other point of view, and therefore invariably lend themselves to interpretations from both points of view.

In order to resolve the issue, additional data for comparison are therefore needed which also differ from native speaker data, but for reasons which are known. As was demonstrated above, language attrition data fulfill this criterion and might therefore prove useful in resolving this question.

The Potential Contribution of Investigations of L1 Attrition

L1 attriters have acquired their first language as monolingual native speakers. However, among both attriters and L2 learners, overall proficiency has been observed to differ from that of monolinguals, and a higher optionality in the application of target rules has been found for the bilingual populations. While for L2 speakers the reasons for this variable performance (underlying representational deficit or problems in online integration of linguistic knowledge) are highly controversial, there are clear indications that no representational deficit obtains for L1 attriters. Should principled comparisons of L1 attriters, L2 learners, and unattrited native speakers reveal that attriters differ from monolinguals in the same way as L2 users do, that would therefore provide compelling evidence for a bilingualism effect and against theories which assume L2 acquisition to be governed by a critical period and L2 knowledge to be fundamentally different from L1 knowledge.

Extending the comparison to include incomplete learners may further render the question of whether there is a qualitative change in the capacity to establish native-like knowledge of a language around puberty empirically testable: If there are representational deficits or differences in processing for post-puberty bilinguals, L1 attriters should be most similar to a monolingual reference group, since their acquisition was unconstrained by the critical period. L2 speakers and incomplete learners should also pattern together, revealing their underlying difference in knowledge and processing. If, on the other hand, a more general bilingualism effect, conditioned by the limitation of available cognitive resources, entrenchment of linguistic knowledge, and proficiency level is responsible, L1 attriters, incomplete learners, and L2 speakers should all differ from largely monolingual native speakers, and this difference should be modulated by factors such as amount of exposure to the non-dominant language and proficiency in that language.

Including L1 attriters in the bilingual equation can therefore help us gain insight into how dominant and non dominant languages are processed in the bilingual mind: these speakers have native-like underlying representations in combination with competition from a highly active and strongly entrenched L2 system. Such comparisons therefore have the potential of providing insight into the nature of bilingual language acquisition and knowledge.

Conclusion

L1 attrition has for a long time been a kind of Cinderella of multilingualism studies. It was considered to be a relatively rare case of language development, one which would

only occur after a reversal of language dominance had taken place and the L1 had been used not at all or only minimally for a long period of time. Speakers who would experience L1 attrition were thought to have, to all intents and purposes, become native speakers of their second language and L2 speakers of their first.

The findings from attrition studies, which typically revealed even those speakers who had the longest migration period one might reasonably expect to occur within the lifespan of an adult human being (five to six decades) to have remarkably few signs of deterioration of their first language knowledge, were therefore often regarded with suspicion. However, cumulative evidence is reinforcing the impression that a completely acquired native language system can, in fact, be extremely stable and impervious to “atrophy” or deterioration in any structural sense. Whatever indications of L2 influence there are to be detected are probably the outcome of a temporary or momentary “winning out” of the L2 system in the process of the formulation of utterances.

This implies that the phenomenon which we refer to as “attrition” is not limited to the relatively rare case of the long-term migrant who has not had occasion to use his or her first language in decades: Crosslinguistic interference, not only from L1 to L2 but also from L2 to L1, is something which all bilinguals experience to some degree. In L1 attriters, the process is merely more noticeable than in L2 learners who continue to use their L1 dominantly.

Based on this realization, studies of L1 attrition have the potential to help us resolve one of the fundamental questions about the nature of language learning: whether languages learned later in life are underlyingly represented in the same manner as native languages or not. I therefore propose that investigations of multilingual development should shift their focus of investigation from comparing L1 versus L2 to comparing dominant versus non dominant languages. If language attriters can ever truly become like a “foreigner,” in the way that Mma Ramotswe felt it about her compatriot, that indicates that those foreigners, like the attriters themselves, probably also do not have a representational deficit in their L2. If, on the other hand, qualitative differences persist between attriters and L2 learners, then those differences can probably be ascribed to a representational deficit on the part of the L2 speakers.

Audiovisual Translation

DELIA CHIARO

Audiovisual translation (AVT) is the term used to refer to the transfer from one language to another of the verbal components contained in audiovisual works and products. Feature films, television programs, theatrical plays, musicals, opera, Web pages, and video games are just some examples of the vast array of audiovisual products available and that require translation. As the word suggests, audiovisals are made to be both heard (*audio*) and seen (*visual*) simultaneously but they are primarily meant to be seen. We talk of “watching” a movie, a show, or even an opera; we “see” programs that are “shown” on television. However, while the verbal and visual codes in audiovisals are linked to such an extent that the words naturally tend to rely heavily on the visuals, the translation of these products operates on a verbal level alone.

Precisely because audiovisual materials are meant to be seen and heard simultaneously, their translation is different from translating print. Written works are primarily meant to be read. Illustrations in books, newspapers, journals, and magazines such as photographs, diagrams, and graphs, are there to accompany and enhance the verbal content. On the other hand the verbal and visual contents of audiovisual products function inseparably to create a meaningful whole.

Audiovisals are made up of numerous codes that interact to create a single effect. On one level, audiovisual products contain a series of verbal messages that will be perceived both acoustically and visually. In filmic products, as well as what the actors say, audiences may also hear the lyrics of songs while simultaneously being exposed to a range of written information such as street signs, billboards, letters, notes, and so forth. Also, at the beginning and end of a program, substantial written information about it, such as the names of the director, producers, the cast, and the production team will also be visible. On a different level, but together with such acoustic and visual verbal input, filmic products also contain nonverbal sound effects and background noises, body sounds (breathing, laughter, crying, etc.), and music. At the same time actors’ facial expressions, gestures and movements, costumes, hairstyles, makeup, and so forth convey additional meaning. Furthermore, scenery, colors, special effects, and three-dimensionality are also part of the filmic whole. AVT needs to take all this diversified verbal and visual information into account bearing in mind that this inseparable link between verbal and visual codes may often constrain the translation process.

Multimedia Translation

Audiovisual products are typically created with the support of technological apparatus. Movie making traditionally involves the use of cameras and celluloid, the creation of Web pages requires a computer and specialized software, and so on. Similarly, many audiovisual products are also consumed by means of diverse technological media. Cinema screens, television sets, computers, and video-game consoles are examples of equipment normally adopted in order to make use of audiovisals. Furthermore, filmic products can be accessed by means of terrestrial, satellite or cable networks, in DVD format or in streaming from a computer connected to the World Wide Web. Likewise, their translations

2 AUDIOVISUAL TRANSLATION

are both created and accessed through one or more electronic devices, hence the overlap with the alternative and all-inclusive term, “multimedia translation.” For example, an AVT modality such as subtitling involves the use of sophisticated software while dubbing and voice-over require specific hardware. In addition, users access these translations by means of screens (i.e., cinema, TV, and computer screens) hence another overlapping term “screen translation.”

However, not all AVT involves screens. Theatrical productions such as musicals as well as opera are examples of audiovisual products that are traditionally performed live on stage. Typically, operas are performed in their original languages while audiences follow the written lyrics in translation in librettos. Speakers of the language in which the opera is performed also resort to librettos to help them understand what the characters are singing as the lyrics may be difficult to understand owing to the particular stress, pitch, and rhythm required by the conventions of the genre. Librettos thus exemplify intralingual translations which, unlike inter-lingual translation that regards language transfer between two different languages, concern the interpretation of verbal signs into a different system of signs in the same language (see Jakobson, 1959). Nowadays, however, opera translation is becoming highly technological with translations projected onto the proscenium in the form of surtitles or else provided in electronic librettos on the back of theatre seats.

Again, while not being strictly audiovisual, in the sense that the reader cannot actually listen to them, comic books have much in common with audiovisual products and the process of their translation involves similar constraints. Comic books consist of a series of framed images with dialogues contained in speech and thought bubbles linked to characters’ mouths in such a way that evokes real dialogue. Furthermore, much of the conventional language in comic books has a highly aural flavor reflected in words, often placed outside speech bubbles, such as “boom!,” “vroom!,” “zoink!,” and “zzzzzzzz.” Graphic frames and dialogues come together to create a narrative that unfolds in real time rather like that of a film. So although comic book images are static, readers are able to imagine speech and noise while following the sequential framework. Thus they can be placed on the interface between print texts and screen products such as films and video games. Significantly, there is a strong tradition of comic characters that subsequently developed into filmic, animated, or both filmic and animated form (e.g., Batman, Spiderman, etc.) while the late 20th century saw the expansion of traditional Japanese comic books, *manga*, into a new form of animated cartoon known as *anime* which have since flourished into a global industry; for example, *Pokemon* and *Dragon Ball* (see Zanettin, 2008).

AVT Modalities

The main modalities for screen translation of fictional products are dubbing and subtitling. Traditionally, Western Europe has been divided into a subtitling block that included Scandinavian and Benelux countries, Greece and Portugal, while the so-called “FIGS” countries (France, Italy, Germany, and Spain) made up the dubbing block. However, nowadays the situation is no longer so clear-cut. The spread of DVD technology and the cost-effectiveness of subtitling has allowed this modality to enter many dubbing strongholds as an alternative. Furthermore, many cinemas in dubbing countries now also offer screenings with subtitles while digital television provides viewers with the choice of both modalities. In addition, political entities such as Wales, Catalonia, and the Basque country choose dubbing as a support for minority languages (O’Connell, 1996; Izard, 2000) while Scandinavian countries which traditionally only dubbed children’s television programs, now also dub some programs for adults (Gottlieb, 2001a). English-speaking countries tend to prefer subtitling for the few foreign language films that enter these markets which tend

to be restricted to educated art-house cinema audiences (Chiaro, 2008, 2009a). Outside Europe, dubbing is strong in mainland China, Japan, Latin America, and Québec while subtitling is the preferred mode in Israel, Hong Kong, and Thailand.

Dubbing

The aim of dubbing is to make the translated dialogue appear as though it is being uttered by the actors in the target language by means of “the replacement of the original speech by a voice track which attempts to follow as closely as possible the timing, phrasing, and lip-movements of the original dialogue” (Luyken, Herbst, Langham-Brown, Reid, & Spinhof, 1991, p. 31).

In the early 20th century, the birth of talking film and the rise of Hollywood led producers to come to terms with the issue of marketing their products in different languages. Initially producers inserted short dialogues in the target language within the English dialogues, but when this proved to be unsatisfactory with audiences, they began producing multiple-language versions of the same film. Paramount Pictures, for example, set up a large studio in Joinville, France, dedicated to the production of these multiple-versions which, however, turned out to be economically unfeasible. The idea of substituting the original voice track with one in another language is generally attributable to the Austrian film producer Jakob Karol, who in 1930 realized that the technology to do this was already available (see Paolinelli & Di Fortunato, 2005, pp. 45–6). At first, dubbing into European languages was carried out in the USA; Hal Roach famously had Laurel and Hardy read off prompts in French, German, Italian, and Spanish, but by the early thirties each European country had begun to set up its own dubbing industries.

According to Danan (1991, p. 612) “dubbing is an assertion of the supremacy of the national language” and is often linked to régimes wishing to exalt their national languages. Indeed it is not by chance that Austria, Germany, Italy, and Spain should opt for dubbing over subtitling while France may well have chosen dubbing to perpetuate its well-established tradition of caring for the French language and protecting it from the onslaught of anglicisms.

Traditionally, the entire process of dubbing a film was overseen by a project manager aided by an assistant who was responsible for negotiating costs, timescales, and general organizational aspects of the process. Dubbing a film began with the literal, word for word, translation of the script. Next, a “dubbing-translator” adapted the translation so that the new target language utterances sounded natural and were in sync with the lip movements of the actors on screen. Dubbing-translators did not need to be proficient in the source language but they did need to be talented in scriptwriting in the target language so as to render the new dialogue as natural and credible as possible. In the meantime, the dubbing assistant would divide the film into “loops” or short tracks and begin organizing studio-recording shifts for the various actors or voice talents. Once recording began, actors watched the film and listened to the original soundtrack through headphones while reading the translated script. However, actors would be free to modify the translated script as they felt fit. The completed recording of the dub was finally mixed and balanced with the international track and musical score. This artisan approach is, however, being largely replaced by digital technology which does away with the need to prepare reels of celluloid into short tracks and for voice talents to perform in a recording studio, as hi-tech allows actors to record from their personal workstations while software will take care of editing different tracks together. Moreover, advances in technology are such that facial and lip movements of actors on film can now be modified to synchronize with the movements of the target language, while other software programs are able to match the voice quality of

the original actor with the recording of the translation giving the impression that it is the original actor speaking (Chiaro, 2009b).

Poland and Russia enjoy a nonsynchronized form of dubbing in which all the different actors, regardless of gender, are dubbed by a single male voice known as a *Lektor*, but may also consist of two voices, one male and one female, voicing-over the male and female characters respectively. This style of dubbing is similar to the modality of voice-over adopted in Europe for nonfiction screen products such as documentaries and news programs. Unlike synchronized dubbing, in voiced-over products the original soundtrack is always discernible and not totally covered by the translated soundtrack. It is also the norm for the initial and final utterances, together with other short pieces of the original speech, known as “sound bites,” not to be voiced over. However, at the time of writing, Russia is slowly converting to a more synchronized form of dubbing.

Subtitling

Subtitles consist of “the rendering in a different language of verbal messages in filmic media in the shape of one or more lines of written text presented on the screen in sync with the original message” (Gottlieb, 2001b, p. 87).

Subtitles are an abbreviated written translation of what can be heard on screen and are known as “open” when they are incorporated onto the film itself and as “closed” when chosen by the viewer from a DVD or teletext menu. At film festivals subtitles are generally projected live onto the screen in real time.

Subtitles considerably reduce the actual dialogue simply because viewers need the time to read them without running the risk of missing any of the action on screen (Antonini, 2005, p. 213). Furthermore, ideally, viewers should be unaware of the fact that they are reading and be able to simultaneously watch the film, read the subtitles, and enjoy it. The subtitling process involves three basic steps: elimination, rendering, and condensation. Elimination consists in reducing elements that do not change the meaning of the source dialogue such as false starts, repetitions, and hesitations. Rendering refers to the elimination of taboo items, slang, and dialect and condensation involves the simplification of original syntax in order to render the subs more easily readable (Antonini, 2005, pp. 213–15). Traditionally a technician carries out the spotting or cueing process that involves marking the transcript of the dialogues according to where the subtitles should begin and end. Translators then gauge their work in line with these cues after which subtitles are checked for sync with changes of frames. However, technology now allows translators to work directly onto electronic files that enable them to create complete products from their personal workstations.

Conventionally, subtitles were restricted to 30 to 40 characters including spaces that were displayed at the center bottom of the picture, or else left-aligned (Gottlieb, 2001b). Nowadays, such restrictions are disappearing as subtitling programs working with pixels allow letters to be modified according to space. Furthermore, wider screens tend to have longer lines and DVDs allow viewers to rewind and re-read features they may have missed, while alignment changes according to the directionality of script in individual languages (Díaz Cintas & Remael, 2007). In addition, because of the possibility of placing the titles anywhere on the screen, the term caption(ing) is now becoming widespread.

Accessibility

Accessibility or “inclusion” refers to the provision of audiovisual products such as plays, films, and opera for all members of the public including those who are in some way

sensorally challenged. Thus accessibility endorses intralingual translations in the form of subtitles, sign language interpreting for the deaf and hard of hearing, and audio-descriptions for the blind and visually impaired. A sign language interpreter will translate verbal information (audio) into meaningful hand signals (visual) while subtitles for the hard of hearing, as well as conveying the verbal contents of audiovisuals, will also transmit other nonverbal acoustic information, such as music and sound effects, in writing. Subtitles for the hard of hearing for TV programs are available in Europe by means of each country's individual teletext service.

Audio-descriptions consist of an additional soundtrack especially recorded for the use of blind and visually impaired people to help them enjoy audiovisual products. During breaks in the dialogues, an off-screen voice provides an account of what is happening on screen. Audio-descriptions are especially common in museums and art galleries thus exemplifying a type of intersemiotic translation in which visual signs are transmuted into verbal signs.

Austin, John L.

MARÍA DEL MAR TORREBLANCA LÓPEZ

John Langshaw Austin (1911–1960) is considered one of the most influential representatives of postwar Oxford *ordinary language* philosophy. Among his main contributions to the philosophy of language is the analysis of performative utterances and its subsequent development into a general conception of “language as action,” which gave rise to *speech act theory*.

J. L. Austin was born in Lancaster, England and educated at Oxford. He started out as a classical scholar, both as a schoolboy and as an early undergraduate, but it was as a philosopher that he was elected to a research fellowship at All Souls, Oxford in 1933 teaching philosophy until 1935 when he became a fellow and tutor at Magdalen, Oxford. His career was interrupted by World War II when he served in MI6 for six years and was decorated for his notable service. After the war, Austin became White’s Professor of Moral Philosophy (1952–60), one of Oxford’s only three professorships of philosophy. He also worked for Oxford University Press as a delegate in 1952 and as chairman of its finance committee from 1957. He was president of the Aristotelian Society from 1956 to 1957.

In 1941 Austin married Jean Coutts (b. 1918) with whom he had four children: two sons, Charles and Richard, and two daughters, Harriet and Lucy. Austin died in Oxford at the age of 48 of liver cancer.

Although greatly admired as a teacher, Austin published little of his philosophical work during his short lifetime. His reputation grew from his personality and the quality, newness, and originality of his work. He held his famous “Austin’s Saturday Mornings” where students and colleagues, such as H. P. Grice, P. F. Strawson, J. O. Urmson, and G. J. Warnock, would discuss language usage and various books. He was a natural leader but not a highly productive or political academic. Austin’s primary dedication was to teaching and as a result he published very little. In his lifetime only seven short papers appeared (1952, 1953, 1961a, 1961b, 1961c, 1966, 1971). He had only published three papers and a translation of Frege’s *Grundlagen der Arithmetik* (1950/1980) when he was elected as White’s Professor in 1952. At his death in 1960 he was still revising and editing for publication his William James’ Lectures that he presented at Harvard University in 1955 and which were finally published as *How To Do Things With Words* (1962/1975). His two other books, *Sense and Sensibilia* (1962) and *Philosophical Papers* (1961/1979) also appeared after his death when some of his students gathered his papers and lectures.

In his philosophical work Austin probably owes his originality to his education in classics and linguistics. He used the study of ordinary language as a valuable tool for philosophy. He believed that in any aspect of discourse, ordinary language, unlike philosophical language, contained all the distinctions man needed to draw and that all of them were probably useful. To clarify these distinctions in any domain would contribute to the solution of many philosophical problems. For him, it is the philosopher’s duty to understand and investigate that ordinary language by means of which people manage to communicate so well.

His major contribution to the philosophy of language and to language study is his theory of speech acts. After developing the theory, he refined the concepts through a series of lectures, clarifying as he went along. Thus, we find differences and contradictions between the preliminary and final definitions of many of the elements of the theory.

In *How To Do Things With Words*, his most influential work, Austin reacts against what was at his time a widespread trend in philosophy and semantics: Logical positivism maintained that only meaningful statements could be tested empirically. Truth conditional semantics holds that any sentence states facts and consequently can be evaluated in terms of veracity or falsity.

Austin realized that particular kinds of utterances were not statements and were not subject to truth conditions. Then, he started by studying a type of utterance that he called *performative* utterances. Performatives did not describe or report anything, and consequently they were not true or false; and the uttering of the sentence is, or is part of, the doing of an action

The initial examples of performative sentences Austin gave were these:

- “I do (sc. take this woman to be my lawful wedded wife)”—as uttered in the course of the marriage ceremony.
- “I name this ship the ‘Queen Elizabeth’”—as uttered when smashing a bottle against the stem.
- “I give and bequeath my watch to my brother”—as occurring in a will.
- “I bet you sixpence it will rain tomorrow.” (Austin, 1962/1975, p. 5)

He took the term “performative” from the verb *to perform* and his first definitions, as we can see in these examples, occur in the first person singular present tense indicative form and often appear with the adverb *hereby*. So in saying “I hereby apologize” you are doing something, namely, apologizing.

Austin first distinguished performatives from constative utterances. He did not want to use the term descriptive because according to him not all of them described something. Constatives were truth evaluable and stated facts whereas performatives completed actions and instead of being true or false, could be happy or unhappy, according to a set of conditions that have to be satisfied for the action to be considered successful.

A. 1. There must exist an accepted conventional procedure having a conventional effect, that procedure to include the uttering of certain words by certain persons in certain circumstances, and further,

A.2 the particular persons and circumstances in the given case must be appropriate for the invocation of the particular procedure invoked.

B.1 The procedure must be executed by all concerned participants both correctly and

B.2 completely.

C.1 Where, as often, the procedure is designed for use by persons having certain thoughts or feelings, or for the inauguration of certain consequential conduct on the part of any participant, then a person participating in and so invoking the procedure must in fact have those thoughts or feelings, and the participants must intend so to conduct themselves, and further,

C.2 must actually so conduct themselves subsequently. (Austin, 1962, pp. 14–15)

Thus, if one says “I lend you my red Ferrari,” and that person does not have a Ferrari, the act would not be happy or felicitous because the person or circumstances would not be appropriate for the performing of that act.

Early in the theory, Austin found it difficult to completely distinguish between performatives and constatives because, after all, to state something was an action itself and that would make all constatives a type of performative.

In Chapter 6, he succinctly introduced the distinction between primary (or explicit) performatives and implicit (or inexplicit) performatives. Primary performatives clearly focus on the act that one is performing by means of a performative verb such as *I apologize*. Implicit or inexplicit performatives function like *Eat!* to perform the act of ordering a child to eat.

For this reason, in chapters 10 and 11, he completely abandoned the original distinction between constatives and performatives replacing it by a more general theory of illocutionary forces. He distinguished between the different kinds of acts one performs in uttering a sentence:

1. the *locutionary act* of using a sentence with a given sense and reference (and within it the phonetic act of making certain noises, the phatic act of uttering certain grammatically well-structured words and the rhetic act of using the words uttered with a certain meaning);
2. the *illocutionary act* performed in performing the locutionary act, which has a certain force or intention saying something; and
3. the *perlocutionary act*, which is the achieving of certain effects by saying something.

In other words, what we say, what we mean when we say it, and what we accomplish by saying it, can be described by this threefold distinction: *locution*, the actual words uttered; *illocution*, the force or intention behind the words; and *perlocution*, the effect of the utterance on the hearer.

This view of language as action would be crucial for the development of pragmatics. By using the formula "By saying X I mean Y," Austin includes intention or force in his theoretical description.

He attempted to further classify utterances according to their illocutionary force into *verdictives*, characterized by the giving of a verdict, such as estimating, convicting; *exercitives*, that exercise powers or rights, such as appointing, ordering; *commissives*, that promise or undertake, such as promising, guaranteeing; *behabitives*, that have to do with social behaviors such as apologizing, congratulating; and *expositives*, that express how we are using words such as replying, conceding. Austin himself was not completely satisfied with this classification but it became the preliminary steps toward a more comprehensive theory of speech acts.

After his death, Austin's theory of speech acts was considerably extended and systematized mainly by his American student John Searle but also by François Récanati, Kent Bach, and Robert Harnish.

Authenticity in the Language Teaching Curriculum

SANDRA MCKAY

Authenticity is clearly a catch term in current language teaching. In the UCLA's Language Materials Project Web site (2009) for less commonly taught languages, one of the major links is for authentic materials that include lesson plans on using such items as signs, postcards, greeting cards, product labels, recipes, menus, and maps for developing language. Indeed there are even entire books devoted to authenticity in language teaching (see Suggested Readings). The popularity and acceptance of authentic materials as a basis for language learning led Day (2003) to refer to the phenomenon as a "cult of authenticity."

In this entry, I begin by explaining the origins of the current emphasis on authenticity in language teaching. I then explore various definitions and views on authenticity and language teaching. In closing I question the current devotion to authenticity as it is presently defined and offer an alternative view of authenticity, one that characterizes the classroom as a community of learners in which students interact with texts and peers about topics/concerns that are important to them.

Communicative Language Teaching and Authentic Materials

The concern with authenticity began in the late 1970s with the development of communicative language teaching (CLT), which evolved largely out of second language educators' discontent with audiolingualism—its behaviorist view of language learning and emphasis on linguistic form rather than meaning. In contrast, CLT, influenced by the work of Hymes (1972), was designed to promote meaningful communication using texts and social situations from the "real" world. For many language educators a central feature of CLT is the use of authentic texts. Nunan (1991), for example, maintains that in CLT there should be the use of authentic texts and an attempt to "link classroom language learning with language activation outside the classroom" (p. 279).

Proponents of CLT encouraged language teachers to use authentic materials as a resource for two main purposes: first, to increase students' motivation by including "real" examples of language use; and second, to illustrate how language is used by a community of first language speakers to serve specific ends. It is important to note that CLT became popular due largely to a rise in the immigrant population in English-speaking countries. In such contexts, texts written for native speakers were readily available in the social environment and students had countless opportunities to observe language use outside of the classroom.

Notions of Authenticity: Content-Based

Definitions of authenticity abound (e.g., Wilkins, 1976; Harmer, 1983; Nunan, 1989) but central to all of them is the idea that authentic materials are written for native speakers with a particular communicative intent. Typically the definition of a "native speaker" is not problematized but taken to be an idealized speaker of the language. Harmer (1983), for example, in the following definition of authentic texts, seems to suggest that language

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

2 AUTHENTICITY IN THE LANGUAGE TEACHING CURRICULUM

students are not speakers of the target language: "Authentic texts (either written or spoken) are those which are designed for native speakers; they are real texts designed not for language students, but for the speakers of the language in question" (1983, p. 146). Even though CLT, with its emphasis on the use of authentic texts from the "real" world, was originally designed for English-speaking environments, soon many foreign language teachers were encouraged by their ministries of education to make use of CLT in their classrooms, for instance in Chile, China, Japan, Korea, and many other countries.

In 1992, for example, the Korean Ministry of Education published a new curriculum, which stated that CLT should replace the audiolingual and translation methods currently used in the schools. Students were encouraged "to learn by means of authentic materials, such as newspapers, magazines, English news on the radio and English TV programs" (Li, 1998, p. 682). In keeping with the wishes of their ministries, conscientious foreign language teachers gathered texts published for "native speakers" to use in their classrooms as a way of implementing CLT.

Few disputed the value of using authentic texts. The one major challenge to their use was Widdowson (1998). Widdowson's major objection to the use of "authentic materials" (i.e., any text designed for native speakers) was his belief that a text needs to be localized to serve a meaningful communicative intent. What makes a text real or authentic is that it is meaningful and appropriate to "a particular set of contextual conditions" (1998, p. 712). For example, a newspaper is real or authentic when it is read by individuals who read it to get news about local and world happenings. Once those conditions are taken away and used for other purposes (e.g., exemplifying a language point) it has lost its genuine purpose of providing information on current news. Widdowson goes on to argue that for texts to be authentic in the language classroom they need to develop from the communicative purposes and discourse of the classroom:

The communicative approach, if it is really to be concerned with pragmatic meaning, has somehow to come to terms with the learners' reality and somehow create contextual conditions that are appropriate to them and that will enable them to authenticate it as discourse on their terms. The language has to be localized so that learners can engage with it as discourse. (1998, p. 712)

Let us take an example. A language teacher, believing in the value of using "authentic" materials, could bring to her classroom a menu taken from a restaurant. Typically menus are designed for customers for the communicative purpose of placing an order in a restaurant. By bringing the text into the classroom, the contextual conditions for placing an order in a restaurant have been lost and hence the text no longer serves an authentic purpose. What makes a text real or authentic in the context of a classroom is that it serves a communicative purpose for that particular group of learners at that specific moment in time.

By taking a text out of the context for which it was intended and placing it in an entirely different social context with another purpose, educators are using texts in an imaginary way. Authentic language learning texts are not those that serve a nonpedagogic purpose with another community of users but rather those texts that particular groups engage with and create discourse around for meaningful purposes.

Notions of Authenticity: Interaction-Based

Another, and more recent, view of authenticity has to do with the authenticity of the interaction itself and with a desire to prepare learners for "real" interactions outside of the classroom. Roberts and Cooke (2009), for example, illustrate how the pedagogical

presentations of institutional encounters such as doctor–patient interactions and job interviews are not an accurate representation of the discourse structure and turn-taking processes of such interactions in the real world. They suggest a research-based pedagogy that uses corpora and discourse analysis to characterize the features of common institutional encounters, arguing that such materials will help learners develop an authentic voice. While there is no doubt that pedagogical materials should be research-based, I question whether or not such materials will necessarily result in the development of an authentic voice.

As Roberts and Cooke (2009) rightly note, “authentic learning is always less about materials and more about how they are used—no cutting and pasting into the classroom can replicate the lived experience of actual interaction” (p. 622). If research-based materials result in formulaic generalizations about a specific type of discourse, such as job interviews, they do little to promote the development of an authentic voice; rather they result in their own kind of artificiality in which learners believe that by learning a particular formula, they will be successful in institutional encounters.

What is needed in classrooms is practice in interactional encounters in which the learners discuss topics that matter to them in their daily lives. This is the kind of authentic voice that a classroom, with carefully chosen topics and tasks, can engender. Clearly the individuals who are in the best position to develop such interactions are classroom teachers, who know their students’ language level and interests, and are fully aware of the role of the target language in the students’ lives, communities, and future needs. Knowing this, teachers can design tasks and conditions that will encourage students to meaningfully engage with a text or with other learners in ways that help them develop an authentic voice. When learners “have a need to communicate from within about matters of importance to them they will strive for the linguistic means to do so” (Roberts & Cooke, 2009, p. 637) and, I would argue, begin to develop an authentic voice.

Authenticity in the language classroom, then, has less to do with matching the classroom with the “real” world and more to do with making the classroom a community of learners where students are given the opportunity to interact with a text or with others in the classroom “about matters of importance to them.” Classroom teachers are key to providing the tasks that will engender such interactions and to allowing students to express their own meaning in their own voice.

Authoring Tools for Language Assessment

GREG KESSLER

Introduction

Authoring tools, which include an array of software designed to create material for computers and the Internet, are ubiquitous throughout the Web development world, including language education. Such tools, designed specifically for language assessment, allow language teachers, material developers, and language department administrators to create a variety of interactive computer-based assessments. These can include embedded media, automated scoring, feedback, and database archival storage of performance. Since the early 1990s a number of such authoring tools have been developed to allow teachers to prepare evaluation and assessment materials for their unique needs. Many of these have become commonplace in classrooms while they may be unfamiliar at institutional levels of assessment, possibly because the assessment needs are different in the classrooms and institutions responsible for test development (Fulcher & Davidson, 2007).

Authoring Tools Commonly Used for Assessment

Authoring tools used in professional test development require technical expertise and have a steep learning curve. These can be considered expert tools. Typically such tools allow developers to customize the tests they create, giving them a great deal of control over the final product. Authoring tools for classroom use are designed to be user-friendly, allowing individuals with limited technical skills to create interactive computer-delivered and Web-based materials. Due to the low level of technical expertise required to use such systems, language assessments can be designed by individuals who focus upon the specific assessment needs of individuals or groups of students.

As Chapelle and Douglas (2006) mention, authoring tools available for computer-assisted language testing (CALT) are too numerous to fully document and “the number and apparent variety of such systems can be overwhelming to developers” (p. 63). Many of these tools are organized into suites, which share many common attributes. These suites typically include common types of questions, the most common of which can be seen in Table 1.

Authoring Tools Within Learning Management Systems

Much can be learned about the range of authoring tools by examining a specific set of tools in detail. This is the approach Chapelle and Douglas (2006) took as they examined WebCT, a commercial learning management system (LMS, also referred to as course management systems). Such systems are commonly used for organizing and delivering instruction. In this examination Chapelle and Douglas discuss the need to align tools with assessment needs and available resources. They also recognize that while being flexible in some respects, these tools often present inherent limitations to design and functionality.

Table 1 Common authoring tool question types

Gap-fill	Short text with gaps
Cloze	Lengthier text with gaps
Mix	Word, phrase, sentence, or paragraph ordering
Multiple choice	Question with 2 to 99 options
True/false	Question requiring positive or negative answer
Multiple select	Question with multiple correct answers
Short answer	Prompt requiring brief student writing
Essay	Prompt requiring lengthier student writing
Crossword	Definition- or terminology-based game
Matching	Pairing items

These can be overcome with varying levels of programming ability, but such abilities are not common among language teachers (Hegelheimer, 2006; Hubbard & Levy, 2006; Kessler, 2006). Typically these shortcomings result in minimal loss of information, if any. They may also result in a negative aesthetic impact. As Chapelle and Douglas note, WebCT can be adequate for some specific needs, but did not allow developers to create an adaptive test or oral assessment. Recent developments have addressed the issue of oral assessment. WebCT (now Blackboard) and Moodle can be used for oral assessment with the inclusion of Wimba and Gong modules respectively. These tools allow users to record audio and video using Webcams. Similar shortcomings are likely to be true of the majority of authoring tool suites. Adaptive tests can be constructed using programming tools such as Flash or Visual Basic, but such tools generally require technical skills beyond the needs of most language teachers or administrators. Moreover, the decision algorithm for item selection requires statistical expertise.

Test developers responsible for testing programs typically work with suites of authoring tools and individual tools that have been developed commercially, but many language teachers take advantage of freely distributed open-source authoring tools. Unlike commercially developed tools, open-source tools are collaboratively designed, maintained and distributed by a community of users, allowing anyone to contribute to the improvement of the product. They may be stand-alone packages or integrated within LMSs such as Moodle, Blackboard, Desire2learn and systems designed by publishers to accompany or replace language textbooks. Those within LMSs are likely the most commonly used authoring tools today. They include suites of generally similar authoring quiz- and question-type creation tools.

One open source widely used in second language learning and assessment, Moodle, offers a set of quiz tools that allow teachers to create quizzes from a pool of established questions or wholly new questions. The delivery of these questions can be randomized and various question forms can be placed in any order within a test. The quiz tools in Moodle include a number of different question types. These can be organized into categories and exported for archival purposes or later importing into another Moodle context. From this window the user can also preview the quiz and view results as well as other information about the quiz. There is no limit to the number of quizzes or questions within a quiz in this system. Similar self-contained suites are also used frequently in language teaching and assessment.

Figure 1 Hot Potatoes jQuiz authoring interface

One Suite of Authoring Tools in Detail

Another well-known open-source tool that has been in use for many years is Hot Potatoes (Half-Baked Software Inc., 2010), a freeware suite of five authoring tools: quiz, mix, crossword, match and cloze. The interface for the Hot Potatoes jQuiz function can be seen in Figure 1.

This figure illustrates the simplicity of Hot Potatoes. All that is necessary to create this test question is to enter a title, a question and the answer options. The correct answer must be identified by checking the “accept as correct” setting. The output of this can be seen in Figure 2.

This quiz type requires students to select a single correct answer. A similar variety allows for multiple correct answers. Hot Potatoes quizzes and exercises also allow embedding a variety of resources, including images, audio, video and emerging forms of technology. Figure 3 demonstrates a Hot Potatoes cloze quiz with a video prompt.

As with all Hot Potatoes quizzes, the author can choose to display the video controller or not, to include clues (author-generated) or hints (a single next letter with each mouse click) for each missing word, and to select from a number of preloaded language interfaces or to create one for an additional language. Other similar sets of tools include Quia (www.quia.com) and Smile (<http://clear.msu.edu/teaching/online/mimea/smile/v2>).

Recent Developments

These basic examples of authoring language assessments provide a foundation for understanding current developments and extensions that provide more powerful resources to all test developers.

Figure 2 Hot Potatoes jQuiz question

Figure 3 Hot Potatoes cloze with video prompt

Third-Party Hosted Tools

Third-party hosted authoring tools are rapidly increasing in popularity, functionality and use. They can be intended for educational use, but are more often designed for a variety of contexts. One obvious example is the large set of tools offered by Google. Many of the tools within Google's domain are finding their way into the language classroom, but two stand out for their language assessment potential: Forms and Voice. Google Forms is a survey

Figure 4 Google Voice transcribed voice mail

tool that is similar to other online survey tools, although others tend to charge a fee for longer surveys. A summary of results can be viewed immediately upon completion and results are also organized into a flexible spreadsheet format. Google Voice does an exceptional job of transcribing speech into text from calls made from a telephone or computer. Figure 4 is a screenshot from Google Voice.

Figure 4 illustrates transcribed voice mail using Google Voice. Transcribed text that is gray is identified as less accurate than text that is black. This distinction could assist in preliminary evaluation of oral proficiency. Such automated preliminary markup can assist evaluators as they attend to more detailed assessment. Individuals are identified and recordings can be played within the window.

Integration and Mash Ups

Mash ups, the combination of two technological resources that together create a new resource, allow for increased functionality with authoring tools. Although Hot Potatoes has been around for many years, it is flexible enough to be used in conjunction with emerging innovative technologies. Hot Potatoes exercises can be directly embedded within Web 2.0 environments such as blogs, Google sites and Moodle. The Hot Potatoes module for Moodle fully integrates Hot Potatoes data within Moodle courses, logs and grade books. This integration allows for immediate, detailed feedback to students, reflecting their performance, as well as longitudinal data that can be explored for trends over time. Results include each mouse click and entry a student makes in a Hot Potatoes exercise. Such record-keeping can provide vital information for varied assessment purposes. Each item and section can also be automatically scored and weighted within the Moodle grade book as deemed necessary and appropriate.

Other mash ups using authoring tools have allowed material and test creators to overcome inherent limitations and embrace emerging technologies. Just as Hot Potatoes allowed media to be embedded into tests, creators can now embed application program interfaces (APIs) that enable the integration of applications within assessment materials as well as dynamic links and embedded streaming media. This allows the inclusion of Web-based applications within an exercise, so that the video window in a Hot Potatoes quiz can be replaced by, for example, a live navigable version of Google Earth. Or, given the specific needs of oral assessment, audio and video recording can be embedded within assessment materials by using Web-based technologies which allow for streaming recording or recording of the learner's speech.

Practical Issues in Authoring Assessments

Using authoring tools for assessment presents a variety of challenges. Chapelle and Douglas (2006) identify and examine six potential threats to CALT: "Different test performance, new task types, limitations due to adaptive item selection, inaccurate automatic scoring, compromised security, and negative impact" (pp. 105–6). Like any test development efforts, the process of authoring assessments to be delivered by computer requires careful atten-

tion to the guidelines provided to language assessment experts. For example, Brown and Abeywickrama (2010) identify six questions that “should form the basis of your approach to designing, administering, and making maximum use of tests in your classroom” (p. 53). These are:

1. What is the purpose of the test?
2. What are the objectives of the test?
3. How will the test specifications reflect both the purpose and the objectives?
4. How will the test item types (tasks) be selected and the separate items arranged?
5. In administering the test, what details should I attend to in order to help students achieve optimal performance?
6. What kind of scoring, grading, feedback, or all three is expected?

The answers to these questions will influence the types of authoring tools chosen. For example, scoring, grading, and feedback need to be taken into account in choosing to use authoring tools including an LMS like Moodle. Moodle allows scoring and grading to be weighted, or based upon a student’s first attempt, final attempt, or average of attempts, or both. For classroom assessment these are automatically recorded to the course grade book. Feedback can be provided to test takers on an item-by-item basis, upon completion of a section or at the end of a test. Feedback can also be made unavailable at any point during the test-taking process. These decisions can be made by test designers as well as instructors within the LMS.

When the test purpose indicates the need for an assessment of work products in portfolios, tools such as Mahara (<http://mahara.org>) and Linguafolios (<http://www.ncssfl.org/links/index.php?linguafolio>) may be needed. LMSs such as Moodle also offer portfolio modules. These include the ability for learners to define goals and track their progress toward these goals while constructing an array of examples of their language production. Teachers and administrators can monitor students’ progress online, and provide feedback and suggestions to guide students toward their goals.

Planning to use computer-delivered tests, however, opens up another set of issues. CALT can be delivered on a single machine, through a local network, and across the Web. These delivery options result in different data collection, data security, and cheating concerns. Local, or client-side, delivery is extremely secure and requires no reliable Internet connection, but does require that data be gathered from individual machines. Client-side delivered tests require proctoring to address cheating concerns. While it is convenient to collect assessment data over the Internet, the level of security for personal information within locally authored tests can be problematic. Of course, password-protected Internet sites increase security and can even assist in test-taker identification. In fact, in some cases such testing may not be consistent with local, institutional, or governmental privacy policies intended to protect students.

Institutions may prefer to use a local area network (LAN) or intranet as a compromise between these two realities. LAN- or intranet-delivered tests allow for the automated gathering of data while offering a greater level of security than an Internet-delivered test. Proctored testing facilities may also make use of an intranet or rely on tools such as IP blocking to prevent cheating. Systems such as NetSupport School (www.netsupportschool.com) address many of these concerns within an environment similar to the LMS. Of course, these concerns primarily affect administrators of language programs and testing centers as well as test developers. Concerns over using Hot Potatoes-constructed tests for higher-stakes testing have been raised (Winke & MacGregor, 2001), but the ability to combine these with other software has addressed most of these concerns. In view of these test-delivery and data-collection options, an additional set of questions should be pondered as test developers consider CALT:

1. Where and how will the test be delivered?
2. What is the anticipated shelf-life of the test?
3. What are the learner characteristics (first language, age, technical skills, etc.)?
4. How will issues of identity be addressed?
5. What concerns relate to cheating?
6. Is this individual or collaborative assessment?
7. Would items or sections benefit from the inclusion of timers?
8. How many times can the test be taken?
9. Are there platform, browser, or other technical requirements?
10. If multiple attempts are made, how is the test scored?
11. How do media contribute to the test?
12. How do linguistic features of the language being tested inform tool selection?
13. How do compatibility standards such as the Sharable Content Object Reference Model (SCORM) influence tool selection?

Answering these fundamental questions will inform test designers in their use of authoring tools. The questions should also serve to help identify which set of authoring tools will be most appropriate for any given use. Anticipating these conditions should streamline the test-creation process since any tool is most effective when it is used in a manner consistent with expectations. This list is by no means exhaustive and there are concerns that existing authoring tools would not be sophisticated enough for the expectations of many testing experts. An exploration of these concerns can be found in Chapelle and Douglas (2006, pp. 74–7).

Conclusion

The continually evolving authoring options available to all test developers make this area one of the most provocative in language assessment. The ability to customize assessment materials by using a simplified authoring tool or suite of authoring tools allows for assessments that are customized in many ways. These options prompt test developers to consider carefully their assessment needs in order to make good decisions and to use the technology to the best advantage for delivering assessments, gathering assessment data, organizing items, and evaluating data.

Automated Essay Evaluation and Scoring

JILL BURSTEIN

Automated essay scoring and evaluation technology is now used in instructional and test preparation products and in low- and high-stakes standardized assessments as well as in some public school, community college, and university settings in the USA. Uses include public school state writing assessments (West Virginia Department of Education, 2009). Each year, this technology is used by thousands of classroom students through instructional applications (Burstein, Chodorow, & Leacock, 2004), and by hundreds of thousands of test-takers through standardized assessments (Attali, 2009).

Scores Versus Feedback

From the user's perspective, a distinction needs to be made between *automated essay scoring* and *automated essay evaluation* systems: The former outputs only a score, while the latter offers diagnostic feedback. The development of automated essay scoring technology began in the 1960s with Project Essay Grade (PEG) (Page, 1966). To compute an essay score, PEG relied largely on the number of words in an essay. More recent and widely used automated scoring approaches, specifically e-rater[®] (Burstein et al., 1998) and Intelligent Essay Assessor[™] (Foltz, Kintsch, & Landauer, 1998; Landauer, Laham, & Foltz, 2000), examine richer linguistic information in essays to compute an essay score. Automated essay evaluation technology was pioneered in the Writer's Workbench application, which contained automated editing and proofreading tools, offering automated feedback related primarily to grammar and mechanics (Macdonald, Frase, Gingrich, & Keenan, 1982).

Since Writer's Workbench, the number of editing and proofreading tools available to writers has grown substantially. Newer applications offer a wider array of feedback. Such technology is used in familiar, everyday tools, such as Microsoft Word's grammatical error detection capabilities (Gamon et al., 2008), and therefore automated evaluation has become a normal part of the writing process for many writers. Research and development of editing and proofreading tools has also resulted in automated essay evaluation tools designed for educational settings, as evidenced by Educational Testing Service's (ETS) Criterion[®] online essay evaluation application (Burstein et al., 2004; Chodorow, Tetreault, & Han, 2007) and similar commercial applications, widely used in classroom settings.

Scoring and evaluation systems that can identify, highlight, and rate the positive linguistic qualities and problems in an essay can provide practical support in low- and high-stakes instructional and assessment settings. In addition, as researchers continue to expand the array of linguistic analyses that can be incorporated into this technology, it will become increasingly helpful to teachers and students in classrooms, and to test administrators and test-takers in assessment settings. In the *classroom*, automated essay evaluation and scoring systems offer students immediate feedback (essay scores and qualitative feedback such as grammatical error detection) that support the revision process (Burstein, Marcu, & Knight, 2003; Burstein et al., 2004). Typically, such systems incorporate functionality for teachers, allowing them to easily assign writing tasks for students, track and review individual

student writing portfolios and outcomes, and support improvement of student writing with immediate feedback (Foltz, Gilliam, & Kendall, 2000; Attali, 2004; Lipnevich & Smith, 2008). The overall effect is that additional writing practice can be added to the curriculum.

Automated essay scoring has been shown to be at least as reliable as human scoring in a number of studies (Burststein et al., 1998; Foltz, Laham, & Landauer, 1999; Landauer, Laham, & Foltz, 2003; Attali & Burststein, 2006; Attali, 2009). The most sophisticated systems, such as those discussed in this chapter, evaluate many of the features in essays that humans would use in the scoring of writing on standardized tests as well. Therefore, such systems are trusted for use in assessment settings. From a practical perspective, automated essay scoring can reduce score reporting times and the high costs that are often associated with human scoring.

Two Technical Approaches

It has taken some time for researchers to develop commercially available automated essay evaluation and scoring systems because of the complexity of the problem of automatically analyzing students' writing. Among the possible solutions, the most successful systems will, most likely, employ one of two primary approaches to model essay data and to compute essay ratings (scores). Two widely used systems, e-rater and Intelligent Essay Assessor (IEA), are discussed here to illustrate these two main approaches, as well as to discuss technology development in this area.

E-rater®: A Construct-Driven Approach to Automated Essay Scoring

E-rater is a commercial automated essay evaluation and scoring system that was developed at ETS. The computational methodology underlying the system is natural language processing (NLP). NLP uses computational techniques suitable to identify and extract linguistic features from stored electronic text or speech. E-rater has been in use since 1999 (Burststein et al., 1998), when it was first operationally deployed and used to provide one of two scores for essays on the writing section of the Graduate Management Admissions Test (GMAT)—a high-stakes assessment for graduate business school admissions. The second score for each essay was provided by an expert human rater. Prior to e-rater deployment, GMAT essays were scored by two independent human raters to score each essay. Since the first version of e-rater proved to be highly reliable, and the system was shown to agree with an expert rater as often as two expert raters agree with each other (Burststein et al., 1998), it made sense, at least from a cost perspective, to use e-rater to generate one of the two scores. So, essentially, the motivation for the first use of e-rater was a highly practical one.

At the same time, research and development around e-rater has *always* developed e-rater features that reflected the *writing construct*. Such features include aspects of essays that one is interested in measuring for a specific writing task. For instance, in expository writing tasks that are used on assessments, human raters are instructed to focus on features in writing that contribute to a high-quality essay. Depending on the construct, and the scoring rubric criteria, these might include the writer's organization and development of ideas, the variety of syntactic constructions, the use of appropriate vocabulary, and the technical correctness of the writing in terms of its grammar, usage, and mechanics. Human raters need to collectively evaluate these aspects of an essay in order to assign a score that reflects the overall, holistic quality of the essay. Using this approach, raters are supposed to take into account all aspects of writing as specified in the scoring guide, often using a 6-point scale, where a score of 6 indicates the highest-quality essay, and a score of 1 indicates an essay of the lowest quality.

E-rater has gone through a number of changes since its first release to accommodate larger coverage of the writing construct. The system combines NLP (automatic detection of linguistic features in text) with statistical methods to compute an essay score. First, e-rater automatically extracts a set of linguistic features, including errors in grammar, usage, and mechanics, style-related features, discourse structure elements, and vocabulary features. Scoring models are then built using regression methods. The feature weights from the models are used to compute a final essay score (Burstein et al., 2004; Attali & Burstein, 2006). Features used for model building and scoring are designed to capture linguistic characteristics (in essays) that represent various aspects in the *writing construct*. Writing construct features for different writing tasks are typically described in scoring rubric criteria designed for human reader scoring. Many of the linguistic features extracted for e-rater scoring are also used for diagnostic feedback that supports a more detailed evaluation of an essay.

The features e-rater identifies include (a) grammatical errors, (b) word usage errors (e.g., *their* versus *there*), (c) mechanics errors (e.g., spelling), (d) presence of essay-based discourse elements (e.g., a thesis statement), (e) development of essay-based discourse elements, (f) style weaknesses (e.g., *overly repetitious words*), (g) a content vector analysis feature comparing an essay to the set of training essays, (h) a content vector analysis feature comparing an essay to the set of training essays that received a score of 6, (i) average word length, and (j) a word frequency-based feature. The *content vector analysis* used in items (g) and (h) is a statistical modeling technique that, very simply stated, compares the frequency of word use in a document (i.e., an essay response) to the frequency of words as they are used in a set of related documents (i.e., a set of human-scored essays in response to a topic). From this information, a score is computed for an essay based solely on the actual words (content) used in the essay. If, in terms of word use, an essay looks more like essays at score point 5 (on a 6-point scale), then a score of 5 would be assigned by the content vector analysis program to the essay in question (see Burstein et al., 1998, for details). This method, like latent semantic analysis (discussed below), does not take into account the order in which words appear in a text.

E-rater modeling was motivated to assign a *holistic rating*. To build a scoring model that will assign scores similar to those assigned by humans, a random sample of human-scored essays (at least 250 essays) are input to e-rater, which detects a predetermined array of linguistic features relevant to scoring rubrics. Each of the linguistic features is converted to a numerical value. Using a regression modeling approach (Attali & Burstein, 2006), the values from this training sample are used to determine an appropriate weight for each feature in the scoring model. To score a new, unseen essay that may appear in a real test administration, for example, e-rater extracts the set of linguistic features and converts them to a vector (list) of values on a numerical scale; these values are multiplied by the weights associated with each feature, and a sum of the weighted feature values is then computed to assign a final score. This final, single score represents e-rater's estimate of the overall (holistic) quality of an essay.

Two kinds of e-rater models can be built. *Topic-specific models* are built using a set of human-scored essays on a given topic, and all 10 features (listed above) are typically used for these models. A topic-specific model can be built only when a sufficient number of human-scored essays exists for the topic. *Generic models* are built using a set of human-scored essay data written by students sampled from the relevant test-taker population, across a number of essay topics. All features except for the content-specific features created for (g) and (h) (listed above) are used to build these models. These models can be applied to essay responses for any topic written by students without new training when new topics are introduced (Attali & Burstein, 2006).

Currently, e-rater is used in low- and high-stakes settings. The system is integrated into ETS's Criterion, a web-based essay evaluation system widely used as an instructional writing application in K–12 and community college settings. Criterion offers immediate, individualized feedback about errors in grammar, usage, and mechanics, the presence and absence of discourse structure elements (e.g., thesis statement, main points, supporting ideas, and conclusion statements), and style advice. The system also provides advisories if an essay is irrelevant to the topic, has discourse structure problems, and contains disproportionately large numbers of grammatical errors (given essay length). All of the diagnostic feedback can be used by students to revise and resubmit an essay. Resubmissions receive additional feedback.

Intelligent Essay Assessor: Modeling Content in Text

Pearson's IEA is a system that uses the Knowledge Analysis Technologies™ (KAT) engine to provide scores and diagnostic feedback for writing tasks. Latent semantic analysis (LSA; see below) is the primary algorithm underlying the scoring engine, and is used to model vocabulary usage as a primary predictor of essay score. LSA models vocabulary in a text and evaluates its semantic similarity to other text samples written about the same topic (test question) and present in texts from content-based reference sources, such as textbooks (Landauer, Laham, Rehder, & Schreiner, 1997; Foltz et al., 1998; Foltz et al., 2000; Landauer et al., 2000). The IEA scoring method is similar to e-rater only in that it requires samples of human-scored essay data to build models for score prediction; otherwise, the two methods use very different techniques for essay modeling and score prediction.

IEA provides an overall holistic score prediction on a 6-point scale, and diagnostic feedback templates with descriptive feedback about the relative quality of the following component essay qualities: Audience and Purpose, Organization, Elaboration, and Use of Language. An example of the feedback for Audience and Purpose is: "While the prompt may be addressed, the main idea may not be clear." For essay evaluation, IEA also offers diagnostic feedback about errors in spelling and grammar. This aspect of the system, however, does not use LSA, since LSA is designed only to model vocabulary (i.e., essay content).

LSA is a corpus-based statistical modeling approach that uses large corpora to model word usage in a given subject domain. LSA generates information about statistical word usage in a document without regard to word ordering. This information for a single document is compared to other documents to determine the similarity between that source document and a large set of reference documents in terms of vocabulary use. Reference documents used for comparison purposes can be textbook material in a particular domain or a corpus of essays. LSA modeling requires a very large corpus of reference documents (several thousand) to reliably model a given domain. The underlying claim is that if LSA determines that two documents are similar with regard to word usage, then they are likely to be semantically similar (i.e., have the same meaning) (Landauer et al., 1997; Foltz et al., 1998; Foltz et al., 2000; Landauer et al., 2000).

Simply stated, LSA is similar in spirit to the content vector analysis method (described earlier). However, in contrast to content vector analysis, LSA is sensitive to the identification of different words that might be used in the same meaning context (e.g., *doctor* and *nurse* in documents about hospitals). Therefore, LSA is a more robust way to derive document comparisons around text meaning. In the context of essay scoring, LSA is trained on reference documents on a particular topic, such as textbook passages, human-scored essay responses to an essay topic, or both. This training creates a semantic representation of topical knowledge. In this representation, each document has been reduced to a vector (list) of numerical values representing the relative importance of words in the reference documents. Using this representation, once the essays have been reduced to the same

vector-based representation, textual segments (e.g., sentences, paragraphs, full essay) can be compared against textual segments in reference documents. Numerical measures of semantic relatedness reflecting meaning similarity between essays (and various text segments of essays), and reference documents can then be derived and used to offer a score or feedback about an essay. This method focuses on essay content and can be used to score essays that respond to opinion- or fact-based topics.

IEA is currently used in Pearson writing products, including WriteToLearn™ and Summary Street®. WriteToLearn is a writing evaluation application where students can submit essays and summaries and receive relevant scores and feedback. For essay evaluation, students receive a holistic score (on a 6-point scale), as well as scores and template-based feedback about the following aspects of the essay: Ideas, Organization, Conventions, Sentence Fluency, Word Choice, and Voice. Spelling and grammatical errors are highlighted for the student. For summary writing, the content of the submission is evaluated in comparison to the original reference document. Students receive a rating of Poor, Fair, or Excellent with regard to content coverage in their summary, as compared to a reference document that they were instructed to summarize. The system also provides feedback about the segments of the original text that were copied verbatim, and suggests that paraphrasing is preferable. In addition, the system advises the student as to which segments of the text appear unrelated to the reference text. Summary Street offers feedback about a student's summary submission that is similar to the feedback offered about summaries in the WriteToLearn application.

Conclusion

Automated essay scoring and evaluation technologies are now widespread in instructional and assessment settings. The continued development of these applications through advances in related computing fields, including NLP, opens doors for the ability to incorporate open-ended, constructed-response writing tasks on standardized tests as desired. Results from research and development have demonstrated the reliability of sophisticated systems when compared with human raters on standardized exams. Automated scoring and evaluation in classroom applications can allow teachers to offer students an increased number of writing experiences over the school year, as these applications can offer support to teachers in the evaluation of student' writing assignments. Research has also shown that such systems that provide feedback can help students improve their writing (Foltz et al., 2000; Attali, 2004; Lipnevich et al., 2008). Further research and development in this area can ultimately support an increasingly larger array of writing-based tasks across a number of student and test-taker populations.

Automatic Speech Recognition

JOHN LEVIS AND RUSLAN SUVOROV

Definition

Automatic speech recognition (ASR) is an independent, machine-based process of decoding and transcribing oral speech. A typical ASR system receives acoustic input from a speaker through a microphone, analyzes it using some pattern, model, or algorithm, and produces an output, usually in the form of a text (Lai, Karat, & Yankelovich, 2008).

It is important to distinguish *speech recognition* from *speech understanding* (or *speech identification*), the latter being the process of determining the meaning of an utterance rather than its transcription. Speech recognition is also different from voice recognition: whereas *speech recognition* refers to the ability of a machine to recognize the words that are spoken (i.e., *what* is said), *voice recognition* involves the ability of a machine to recognize speaking style (i.e., *who* said something).

Historical Overview

Pioneering work on ASR dates to the early 1950s. The first ASR system, developed at Bell Telephone Laboratories by Davis, Biddulph, and Balashek (1952), could recognize isolated digits from 0 to 9 for a single speaker. In 1956, Olson and Belar created a phonetic typewriter that could recognize ten discrete syllables. It was also speaker-dependent and required extensive training.

These early ASR systems used template-based recognition based on pattern matching that compared the speaker's input with prestored acoustic templates or patterns. Pattern matching operates well at the word level for recognition of phonetically distinct items in small vocabularies, but is less effective for larger vocabulary recognition. Another limitation of pattern matching is its inability to match and align input speech signals with prestored acoustic models of different lengths. Therefore, the performance of these ASR systems was lackluster because they used acoustic approaches that only recognized basic units of speech clearly enunciated by a single speaker (Rabiner & Juang, 1993).

An early attempt to construct speaker-independent recognizers by Forgie and Forgie (1959) was also the first to use a computer. Later, researchers experimented with time-normalization techniques (such as dynamic time warping, or DTW) to minimize differences in speech rates of different talkers and to reliably detect speech starts and ends (e.g., Martin, Nelson, & Zadell, 1964; Vintsyuk, 1968). Reddy (1966) attempted to develop a system capable of recognizing continuous speech by dynamically tracking phonemes.

The 1970s were marked by several milestones: focus on the recognition of continuous speech, development of large vocabulary speech recognizers, and experiments to create truly speaker-independent systems. During this period, the first commercial ASR system called *VIP-100* appeared and won a US National Award. This success triggered the Advanced Research Projects Agency (ARPA) of the US Department of Defense to fund the Speech Understanding Research (SUR) project from 1971 to 1976 (Markowitz, 1996). The goal of SUR was to create a system capable of understanding the connected speech

2 AUTOMATIC SPEECH RECOGNITION

Figure 1 A simple four-state Markov model with transition probabilities

of several speakers from a 1,000-word vocabulary in a low-noise environment with an error rate of less than ten percent. Of six systems, the most viable were *Hearsay II*, *HWIM* (hear what I mean), and *Harpy*, the only system that completely achieved SUR's goal (Rodman, 1999). The systems had a profound impact on ASR research and development by demonstrating the benefits of data-driven statistical models over template-based approaches and helping move ASR research toward statistical modeling methods such as hidden Markov modeling (HMM).

Unlike pattern matching, HMM is based on complex statistical and probabilistic analyses (Peinado & Segura, 2006). In simple terms, hidden Markov models represent language units (e.g., phonemes or words) as a sequence of states with transition probabilities between each state. To move from one state to another, the model will use the highest transition probability (see Figure 1).

The main strength of HMM is that it can describe the probability of states and represent their order and variability through matching techniques such as the Baum-Welch or Viterbi algorithms. In other words, HMM can adequately analyze both the temporal and spectral variations of speech signals, and can recognize and efficiently decode continuous speech input. However, HMMs require extensive training, a large amount of memory, and huge computational power for model-parameter storage and likelihood evaluation (Burileanu, 2008).

Although HMM became the primary focus of ASR research in the 1980s, this period was also characterized by the reintroduction of artificial neural network (ANN) models, abandoned since the 1950s due to numerous practical problems. Neural networks are modeled on the human neural system. A network consists of interconnected processing elements (units) combined in layers with different weights that are determined on the basis of the training data (see Figure 2). A typical ANN takes an acoustic input, processes

Figure 2 A simple artificial neural network

it through the units, and produces an output (i.e., a recognized text). To correctly classify and recognize the input, a network uses the values of the weights.

The main advantage of ANNs lies in the classification of static patterns (including noisy acoustic data), which is particularly useful for recognizing isolated speech units. However, pure ANN-based systems are not effective for continuous speech recognition, so ANNs are often integrated with HMM in a hybrid approach (Torkkola, 1994).

The use of HMM and ANN in the 1980s led to considerable efforts toward constructing systems for large-vocabulary continuous speech recognition. During this time ASR was introduced in public telephone networks and portable speech recognizers were offered to the public. Commercialization continued in the 1990s, when ASR was integrated into products from PC-based dictation systems to air-traffic-control training systems.

During the 1990s, ASR research focused on extending speech recognition to large vocabularies for dictation, spontaneous speech recognition, and speech processing in noisy environments. This period was also marked by systematic evaluations of ASR technologies based on word or sentence error rates and constructing applications that would be able to mimic human-to-human speech communication by having a dialogue with a human speaker (e.g., Pegasus and How May I Help You?). Additionally, work on visual speech recognition (i.e., recognition of speech using visual information such as lip position and movements) began and continued after 2000 (Liew & Wang, 2009).

The 2000s witnessed further progress in ASR, including the development of new algorithms and modeling techniques, advances in noisy speech recognition, and the integration of speech recognition into mobile technologies. A more recent trend is the development of emotion recognition systems that identify emotions from speech using facial expressions, voice tone, and gestures (Schuller, Batliner, Steidl, & Seppi, 2009).

Characteristics of ASR Systems

Speech recognition systems can be characterized by three main dimensions: speaker dependence, speech continuity, and vocabulary size. According to the speech data in the training database, ASR systems can be *speaker-dependent* (when the system has to be trained for each individual speaker), *speaker-independent* (when the training database contains numerous speech examples from different speakers so the system can accurately recognize any new speaker), and *adaptive* (when the system starts out as speaker-independent and then gradually adapts to a particular user through training). From the dimension of speech continuity, there are (a) *isolated (or discrete) word recognition systems*, which identify words uttered in isolation; (b) *connected word recognition systems*, which can recognize isolated words pronounced without pauses between them; (c) *continuous speech recognition systems*, which are capable of recognizing whole sentences without pauses between words; and (d) *word spotting systems* that extract individual words and phrases from a continuous stream of speech. Finally, ASR systems can be characterized based on the vocabulary size (i.e., small or large vocabulary) to which they are trained.

The performance of speech recognition systems depends on each of the three dimensions and is prone to three types of errors: errors in discrete speech recognition, errors in continuous speech recognition, and errors in word spotting (Rodman, 1999). Errors in discrete speech recognition include deletion errors (when a system ignores an utterance due to the speaker's failure to pronounce it loudly enough), insertion errors (when a system perceives noise as a speech unit), substitution errors (when a recognizer identifies an utterance incorrectly, e.g., *We are thinking* instead of *We are sinking*), and rejection errors (when the speaker's word is rejected by a system, for instance, because it has not been included in the vocabulary). Errors in continuous speech recognition can also involve the same types

of errors. In addition, this group contains splits, when one speech unit is mistakenly recognized as two or more units (e.g., *euthanasia* for *youth in Asia*), and fusions, when two or more speech units are perceived by a system as one unit (e.g., *deep end* as *depend*). Finally, errors in word spotting include false rejects, when a word in the input is missed, and false alarms, when a word is misidentified.

According to another classification, errors in ASR systems can be direct, intent, and indirect (Halverson, Horn, Karat, & Karat, 1999). A direct error appears when a human misspeaks or stutters. An intent error occurs when the speaker decides to restate what has just been said. Finally, an indirect error is made when an ASR system misrecognizes the speaker's input.

Challenges and Applications of ASR

Automatic speech recognition is multidisciplinary. State-of-the-art ASR systems require knowledge from disciplines such as linguistics, computer science, signal processing, acoustics, communication theory, statistics, physiology, and psychology. Developing an effective ASR system poses a number of challenges. They include speech variability (e.g., intra- and interspeaker variability such as different voices, accents, styles, contexts, and speech rates), recognition units (e.g., words and phrases, syllables, phonemes, diphones, and triphones), language complexity (e.g., vocabulary size and difficulty), ambiguity (e.g., homophones, word boundaries, syntactic and semantic ambiguity), and environmental conditions (e.g., background noise or several people speaking simultaneously).

Despite these challenges, there are numerous commercial ASR products, including Dragon NaturallySpeaking, Embedded ViaVoice, Loquendo, LumenVox, VoCon, and Nuance Recognizer. Some of these have applications in computer-system interfaces (e.g., voice control of computers, data entry, dictation), education (e.g., toys, games, language translators, language learning software), healthcare (e.g., systems for creating various medical reports, aids for blind and visually impaired patients), telecommunications (e.g., phone-based interactive voice response systems for banking services, information services), manufacturing (e.g., quality control monitoring on an assembly line), military (e.g., voice control of fighter aircraft), and consumer products and services (e.g., car navigation systems, household appliances, and mobile devices).

ASR in Applied Linguistics

ASR has tremendous potential in applied linguistics. In one application area, that of language teaching, Eskenazi (1999) compares the strengths of ASR to effective immersion language learning in developing spoken-language skills. ASR-based systems can provide a way for learners of a foreign language to hear large amounts of the foreign language spoken by many different speakers, produce speech in large amounts, and get relevant feedback. In addition, Eskenazi (1999) suggests that using ASR computer-assisted language learning (CALL) materials allows learners to feel at greater ease and get more consistent assessment of their skills. ASR can also be used for virtual dialogues with native speakers (Harless, Zier, & Duncan, 1999) and for pronunciation training (Dalby & Kewley-Port, 1999). Most importantly, learners enjoy ASR applications. Study after study indicates that appropriately designed software that includes ASR is a huge plus to language learners in terms of practice, motivation, and the feeling that they are actually communicating in the language rather than simply repeating predigested words and sentences.

The holy grail of a computer that matches human speech recognition remains out of reach at present. A number of limitations are consistently obvious in attempts to apply

ASR systems to foreign-language-learning contexts. The major limitations occur because most ASR systems have been designed to work with a limited range of native speech patterns. Consequently, most ASR systems do not do well in recognizing non-native speech, both at the phone level and for prosody (Eskenazi, 1999). In one study, Derwing, Munro and Carbonaro (2000) tested Dragon NaturallySpeaking's ability to identify errors in speech of very advanced L2 speakers of English. While human listeners were able to successfully transcribe between 95% and 99.7% of the words, the recognition rates by the program were a respectable 90% for native English speakers, but only 71–2% for the non-native speakers. In addition, ASR systems have been built for recognition rather than assessment and feedback, but language learners require feedback on their speech to make progress.

Automatic Rating of Pronunciation

Many studies have examined whether ASR systems can identify pronunciation errors in non-native speech and give feedback that can help learners and teachers know what areas of foreign-language pronunciation are most important for intelligibility. Dalby and Kewley-Port (1999) demonstrate that such diagnosis and assessment are possible (to some extent) for minimal pairs, and that automatic ratings of pronunciation accuracy can correlate with human ratings. However, the kind of feedback given to learners is not usually very helpful. For those systems that attempt to do so, there are two options: giving a global pronunciation rating or identifying specific errors. To reach either of these goals, ASR systems need to identify word boundaries, accurately align speech to intended targets and compare the segments produced with those that should have been produced. A variety of systems have been designed to provide global evaluations of pronunciation using automatic measures including speech rate, duration, and spectral analyses (e.g., Neumeyer, Franco, Digalakis, & Weintraub, 2000; Witt & Young, 2000). All of the studies have found that automatic measures are never as good as human ratings, but a combination of automatic measures is always better than a single rating.

ASR systems also have trouble precisely identifying specific errors in articulation, sometimes identifying correct speech as containing errors, but not identifying errors that actually occur. Neri, Cucchiari, Strik, and Boves (2002) found that as few as 25% of pronunciation errors were detected by their ASR system, while some correct productions were identified as errors. Truong, Neri, de Wet, Cucchiari, and Strik (2005) studied whether an ASR system could identify mispronunciations of three sounds typically mispronounced by learners of Dutch. Errors were successfully detected for one of the three sounds, but the ASR system was less successful for the other sounds. Overall, ASR systems still cannot behave like trained human listeners, and the systems remain far more successful for phone-level recognition and assessment than for prosody.

Other ASR Applications in Applied Linguistics

There are other areas in which ASR has been used by applied linguists: reading instruction, feedback for spoken liveliness, and the use of ASR in dialogue systems used with language-learning software.

One use of ASR that seems to have been particularly successful has been in teaching children to read. Mostow and Aist (1999) found that ASR used in conjunction with an understanding of teacher–student classroom behavior was successful in teaching oral reading skills and word recognition. In a more recent study, Poulsen, Hastings, and Allbritton (2007) found that reading interventions for young learners of English were far more effective when an ASR system was included.

An unusual use of ASR in providing feedback is evaluation of spoken liveliness. ASR is particularly ill-suited to providing feedback on prosody, despite moderate success reported by Eskenazi (1999). However, Hincks and Edlund's (2009) ASR recognizer used automatic measures of pitch-range variation to provide feedback to learners of English giving oral presentations in English. Using overlapping 10-second measures of pitch-range variation, learners were given feedback on how much "liveliness" their voices projected. By increasing pitch-range variations, learners were able to control the movement of the feedback display, and thus increase the amount of engagement in their speech.

A third use of ASR technology is in spoken CALL dialogue systems. If a software program for practicing spoken language provides the first line of a dialogue, learners give one of two responses. If these responses are dissimilar, the ASR system can recognize which sentence has been spoken (even with pronunciation errors or missing words). The computer can then respond, allowing the learner to respond again from a menu of possible responses (see Bernstein, Najmi, & Ehsani, 1999; Harless, Zier, & Duncan, 1999). O'Brien (2006) reviews a number of such programs.

Future Directions

Automatic speech recognition holds great promise for applied linguistics, although this promise has not yet been fully realized. ASR research and usability testing is happening in areas likely to impact applied linguistics (e.g., Anderson, Davidson, Morton, & Jack, 2008). For example, the annual INTERSPEECH conference (held through the International Speech Communication Association, or ISCA) and the International Conference on Acoustics, Speech and Signal Processing (ICASSP) bring together those working in areas that will eventually influence linguistic applications.

The connections between ASR and text-to-speech software have been insufficiently explored, but both hold promise for non-native speech applications. Also, the ubiquity of mobile devices that use ASR-based applications will allow L2 learners to practice their L2 speaking skills and receive feedback on their pronunciation. Further progress in ASR will result in interactive language-learning systems capable of providing authentic interaction opportunities with real or virtual interlocutors. These systems will also eventually be able to produce specific, corrective feedback to learners on their pronunciation errors. Additionally, the development of noise-resistant ASR technologies will allow language learners to use ASR-based products in various noise-prone environments such as classrooms, transportation, and other public places. Finally, the performance of ASR systems will improve as emotion recognition and visual speech recognition (based, for instance, on a Webcam's capturing of learners' lip movements and facial expressions) become more effective and widespread.

Automatization, Skill Acquisition, and Practice in Second Language Acquisition

ROBERT DEKEYSER AND RAQUEL CRIADO

Skill Acquisition (Declarative, Procedural, Automated Knowledge)

In the last few decades, the study of second language acquisition has been dominated by perspectives from linguistics, in particular syntactic theory, psycholinguistics, and sociolinguistics. Cognitive-psychological perspectives are increasingly common in the study of the mental lexicon and online processing. Given, however, that second/foreign language proficiency implies a set of skills that enable speakers to comprehend and produce messages quickly and efficiently, cognitive psychology in general and skill acquisition theory in particular are also unquestionably relevant to second language acquisition, assuming that one is interested in what students can do with the language at various stages of learning, and not just what the underlying abstract competence is.

The roots of skill acquisition theory are to be found in different schools of psychology, ranging from behaviorism to cognitivism and connectionism. The basic claim of skill acquisition theory is, as stated by DeKeyser (2007a, p. 97), that there exists a series of sequenced stages, from initial representation of knowledge to highly skilled behavior, and a common set of “basic principles” underlying the acquisition of skills. Such “basic principles” must necessarily take into account two aspects: (a) the three types of knowledge involved in the learning of a skill, i.e., declarative, procedural, and automatized; and (b) the actual stages required for attaining full command of a skill—initial acquisition, gradual development, and final consolidation.

Declarative knowledge is “knowing that,” that is, knowledge or information about things and facts, which in the case of language is the knowledge of morphosyntactic and phonological rules and word meanings. In declarative processing, the relevant information to perform a linguistic operation is recruited from long-term memory and transferred into working memory, which holds the rule or word meaning while the operation is being executed. Consequently, the latter process “can place a heavy burden on working memory capacity” (Anderson, 1982, p. 381).

Procedural knowledge is “knowing how.” It is related to knowledge about how to perform various processes or behaviors, e.g., “our ability to understand language or to apply our knowledge of rules to solve a problem” (O'Malley, Chamot, & Walker, 1987, p. 294). Procedural knowledge is represented in our memory as a set of “productions” (Anderson, 1982), that is a set of if-X-then-do-Y rules, and is associated with implicit, unconscious knowledge. For example, in the formation of the past of the verb “talk,” a specific “program” (following a computer simile) leads the student to the past of “talk” via a rule that requires adding the ending -ed to the stem of the verb.

Automatized knowledge is the result of restructuring and fine-tuning of procedural knowledge so that the relevant (linguistic) behavior is displayed correctly and rapidly. This

2 AUTOMATIZATION, SKILL ACQUISITION, AND PRACTICE

restructuring and fine-tuning encompasses both qualitative changes such as putting various often co-occurring production rules together into one chunk, which is then retrieved from long-term memory as a whole, and mere quantitative changes such as speeding up retrieval and adjusting the probability that a rule is activated to minimize errors.

The role of declarative and procedural knowledge in skill acquisition is accounted for in the successive stages distinguished by researchers to explain skill development. Such stages have received different labels: cognitive, associative, and autonomous (Fitts & Posner, 1967); declarative, procedural, and automatic (Anderson, 1982, 1993; Anderson, Bothell, Byrne, Douglass, Lebiere, & Qin, 2004) or, as applied to language teaching, presentation, practice, and production—the three Ps or the Presentation–Practice–Production pattern of activity sequencing (Byrne, 1986; Criado, 2010). This varying terminology does not affect the actual conceptualization of the three stages. First, learners develop a declarative encoding—factual information relevant to the skill—by themselves or, more often, by means of instruction or observation of an expert (e.g., a parent teaching a child how to ride a bicycle). Second comes the phase when declarative knowledge leads to procedural knowledge. Performance in this middle stage is still slower and more imperfect than in the final autonomous/automatic stage, whose outcome, automatized knowledge, does not require any conscious processing. As highlighted by DeKeyser (2007a, pp. 98–9), “A large amount of practice is needed to decrease the time required to execute the task (reaction time), the percentage of errors (error rate), and the amount of attention required (and hence interference with/from other tasks). This practice leads to gradual automatization of knowledge.”

Correct proceduralization is vital for successful skill acquisition. For that purpose, two elements are essential. The first of these is a previous declarative base acting as the trigger for procedural knowledge acquisition. Although Anderson and Fincham (1994) acknowledge that not all learning is always supported by an initial declarative base, they also claim that “the research indicates that this is a major avenue for the acquisition of procedural knowledge” (p. 1323). The second essential element is that the specific task or target behavior should include a suitable arrangement of conditions for declarative knowledge to be drawn upon (see *The Role of Practice in L2 Skill Acquisition*, below).

Automatization

While different characteristics of automaticity have been stressed by different researchers (for overviews see DeKeyser, 2001; Segalowitz, 2003), there is general agreement that the more automatized knowledge is, the less attention it requires and the less error-prone it is. Automaticity is now usually seen as the somewhat idealized end point of the process of automatization. Even highly automatized activities still require some degree of attention and can still interfere with (or be interfered with by) other activities, as driving accidents or arithmetic errors show.

Most researchers nowadays also see qualitative change as a characteristic of automatization, as opposed to mere speeding up. Segalowitz and Segalowitz (1993), in particular, argued that automatization implies elimination or at least reduction of some components of a cognitive process. The components being eliminated tend to be highly variable, so that automatization is characterized not only by a reduction in reaction time (RT), but also by reduced variability. As a result, the coefficient of variation (CV, the standard deviation divided by the mean) becomes smaller during automatization, while many studies have documented a strong correlation between the mean and the standard deviation for RT where cognitive processes merely speed up over time, resulting in a stable coefficient of variation (see especially Wagenmakers & Brown, 2007). Few researchers have adopted change in CV as a criterion for automatization, however, and Hulstijn, van Gelderen, and

Schoonen (2009) argue that, while the proposal “that genuine automatization is characterized by a reduction or elimination of initially highly variable component processes remains a viable hypothesis,” the coefficient of variation in itself is an imperfect operationalization, and more sophisticated experimental tasks are needed that are “capable of tapping component processes more directly” (p. 579). A step toward achieving this goal may be to isolate the different strategies that different individuals may use for a given task, because the power law of practice applies to these strategies rather than to tasks as a whole (Delaney, Reder, Staszewski, & Ritter, 1998; Jones, Ritter, & Wood, 2000; Rickard, 1997, 2004).

That qualitative changes of some kind take place is increasingly clear from neuroimaging research. For a variety of tasks, even over a relatively short time span, one sees reduction of activity in some brain areas, in particular the frontal and parietal cortex, showing the diminishing role of attention and domain-general processes. Once a very narrowly defined task is highly practiced, only very small areas show any substantial activation (see e.g., Hill & Schneider, 2006; Schneider & Chein, 2003). After very extensive long-term practice (e.g., spatial navigation in taxi drivers), however, even structural changes in the nervous system can be observed (Maguire et al., 2000).

For the sake of completeness it should be pointed out that a number of researchers hold radically different views of automatization and automaticity from those that see these processes as gradual quantitative and qualitative changes in the use of rules. For Logan (1988, 2002), for instance, automaticity, rather than efficient use of a rule, implies retrieval of an instance from memory that is very similar to the one currently being processed. Paradis (2009), on the other hand, does not accept the notion of various degrees of automatization: “A task component cannot be more or less automatized. It either is automatized or it is not” (p. xi). For him, knowledge originally acquired in declarative form can only be sped up, not automatized, and the only knowledge characterized by automaticity is implicit knowledge (in his view necessarily acquired implicitly).

Leaving some definitional and terminological issues aside, however, it is clear that a certain degree of automatization in a broad sense of the term is an important part of the language-learning process, in particular in the initial stages of instructed language learning (DeKeyser, 2007a). Therefore, an important part of curriculum planning is to figure out how language teaching can provide the kind of practice that is able to bring about a certain degree of automatization. These issues are discussed further below: The Role of Practice in L2 Skill Acquisition provides a sketch of what this means for the concept of practice; and Practice in Context elaborates these notions for various teaching contexts.

The Role of Practice in L2 Skill Acquisition

Many scholars state that reaching automaticity requires massive, repetitive, and consistent practice (Shiffrin & Schneider, 1977; Schmidt, 1992; Segalowitz, 2003; DeKeyser, 2007b). The type of practice activities suitable for developing the three types of knowledge is summarized in the following quotation by DeKeyser (1998, p. 58), focused on grammar: “Explicit teaching of grammar, followed by FonF activities to develop declarative knowledge, and then gradually less focused communicative exercises to foster proceduralization and automatization.” The well-known three Ps activity sequencing pattern in foreign-language instruction is implicitly distinguished here. For the relationship between the three Ps and declarative, procedural, and automatized knowledge, see Criado (2010, p. 84).

Declarative Knowledge

The acquisition of declarative knowledge is launched through the initial phase of instruction, which consists of explicit teaching of rules to achieve complete understanding. Sheer

4 AUTOMATIZATION, SKILL ACQUISITION, AND PRACTICE

understanding does not mean that declarative knowledge has been fully acquired and consolidated. This is achieved through quite controlled, discrete-item-based practice in the shape of form-focused exercises; for example, fill-in-the-blanks, sentence-combining, some forms of translation, etc. The purpose of this practice is (a) to develop, test, and refine declarative knowledge in long-term memory, and (b) to ensure its correct anchoring in the student's mind so that it can be later drawn upon, helping in the process of proceduralization. Accordingly, learners should have enough time to attain declarative knowledge before engaging in linguistic production; in other words, they should not be pressured into rushed output.

Proceduralization

In instructed second language learning the basic condition for proceduralization is engaging in the target rule-governed behavior while relying on temporary declarative crutches kept in working memory. The repetition of these processes permits "the restructuring (see Cheng, 1985; McLaughlin, 1990) of declarative knowledge in ways that make it easier to proceduralize" and allows "the combination of co-occurring elements into larger chunks that reduce the working memory load" (DeKeyser, 1998, p. 49).

The suitable type of practice in this phase is communicative drills. As opposed to the previous type of practice exercises, communicative drills emphasize content without neglecting attention to form (see Littlewood's (1981) distinction between "precommunicative" and "communicative" activities). Thus, the establishment in long-term memory of form-meaning relationships will start and lead to proceduralization.

Automatization

Finally, in order to attain fluid and error-free automatic language use, the learner should undergo extensive practice of the procedures or target language behaviors in communicative activities that may promote "automaticity in the language learning situation in a manner that respects transfer-appropriate processing and other positive features of communicative practices" (Segalowitz, 2003, p. 402). These activities are open-ended and fully focused on meaning, such as debates, extended role plays, and simulations, essays, etc.

Practice in Context

Given the skill-specific nature of practice documented above (see Skill Acquisition), practice will differ depending on which of the four skills (reading, writing, listening, speaking) is the most immediate or most important goal. At the same time, the nature of practice differs considerably depending on the context. Traditional foreign-language teaching relies heavily on systematic practice in the P-P-P sense described above. Second language learning differs from foreign-language learning in various ways that have an impact on the frequency and usefulness of various forms of practice. On the one hand, the input available from the environment outside school may seem to make classroom practice in the receptive skills somewhat less necessary, but on the other hand, given that practice outside the classroom is easily available, it would be a shame if students could not make the most of it because they are ill-prepared to recognize elements in the input that are not very salient, but important for understanding. That is why systematic practice in the sense of processing instruction (see e.g., VanPatten, 2004) is so important in this context, especially for adults whose capacity for implicit learning is seriously limited (DeKeyser, 2003, 2009). Both input and output practice in a second language learning context should aim to prepare students to learn more from interaction with the out-of-class environment, not

only for the psycholinguistic reason just mentioned, but also to have face validity and not give the impression that classroom practice is an artificial activity with no bearing on real-life communication.

Study abroad, in many ways, is a context that shares characteristics of both foreign-language learning and second language learning, because it is meant to make students make the transition from the foreign-language classroom to the native-speaking environment. Just as for second language learning contexts, then, it is important that students be well prepared for practicing their language skills in interaction with native speakers. DeKeyser (2007c) shows how study abroad can lead to very disappointing results when students are not ready to benefit from this context because of insufficient declarative, let alone proceduralized, knowledge. Similar phenomena can be observed in bilingual education: in spite of the large amount of input and interaction available for years on end, students in bilingual programs often fail to learn certain structures in the absence of enough systematic practice (see e.g., Swain, 1985; Ranta & Lyster, 2007).

It is very important, of course, not to confuse systematic skill development with overly repetitive drills focused on individual forms. Practice, especially at more advanced stages, can take the form of real-world tasks, adapted to the communicative needs (see Long, 2005) and aptitudes for learning (see Robinson, 2007) of individual learners (Norris, 2009). Such tasks are both more motivating and better for transfer to use in the real world than decontextualized practicing of forms. Even at rather basic levels, teachers can play an important role in designing classroom tasks and choosing activities in a way that will help the students to draw on their declarative knowledge in the performance of a communicative task (e.g., Toth, 2006, 2008). In the case of children, special efforts need to be made to make practice age-appropriate and intrinsically motivating, e.g., through various forms of play (Cameron, 2001; Muñoz, 2007).

An important new development in the area of practice is the array of possibilities offered by information technology, from narrowly focused mechanical practice to free communication between learners and native or other non-native speakers. When computer-assisted language learning started out decades ago, it was mostly limited to the very first stage of practice, repetitive drilling. During the 1980s and 1990s, researchers tried to develop very sophisticated forms of learner-computer interaction with the aid of artificial intelligence (AI) tools. While these had the advantage of involving meaning and being to some extent communicative, they still did not imply interaction with other human beings and at the same time were very expensive to design and very rigid to use. As a result, this approach has been overtaken by the boom in Internet technology, from e-mail to instantaneous messaging, which offers learners opportunities to practice L2 with each other or with native speakers under different degrees of time pressure, and with different degrees of attention to form (see e.g., Payne & Whitney, 2002; Fernández-García & Martínez-Arbelaiz, 2002, 2003; Chapelle, 2009). These forms of interaction are sometimes called computer-mediated communication (CMC). Meaning in this context comes from the human beings interacting, and the computer is simply a convenient way of putting them in touch and of putting some constraints on the interaction. Such constraints are often more helpful in the sense of taking some of the pressure off (the communication is not face-to-face, and there is less time pressure than in speaking) than they are artificial (as they coincide largely with many young people's preferred modes of peer interaction). The drawback of CMC is that there is usually no provision for feedback (which means "speakers" are not aware of their errors and "hearers" are exposed to faulty input), and that to the extent feedback can be given, it is very much delayed or incomplete. The ultimate practice of the future may involve CMC monitored by a computer with little AI, except in the area of natural language processing, used both to give feedback to the "speaker" and filtered input to the "hearer," but such technology will require many more years of research in natural language processing.

Summary and Conclusions

While systematic practice is by no means the only mechanism for second language learning, there is no reason to doubt that skill acquisition applies to second language learning just as it does to other cognitive skills. This is especially the case for early stages of language learning and for instructed language learning. The fact that automatization takes a long time and that full automaticity of explicitly learned structures is probably never achieved is no reason to reject explicit learning and practice in favor of nonsystematic implicit learning through large amounts of exposure (especially as quantity and quality of exposure are usually limited for adult learners, and implicit learning does not lead to native-like competence even in the best circumstances). The nature of explicit teaching and practice, however, needs to be adapted to the context of learning and to the goals, aptitudes, and age of the learners. Most importantly of all, if practice is to be maximally effective for skill acquisition, it should try to stay as close as possible to the target skills. In the case of language learning, that means that linking forms and meanings should always be in focus.

Aviation English

CAROL LYNN MODER

Aviation English is a term for the highly specialized language and interactional sequences used by pilots, air traffic controllers, and other aviation professionals. Like other areas of language for specific purposes (LSP), aviation English focuses on the particular pronunciation, vocabulary, grammatical structures, and discourse styles that are commonly used by practitioners in specific work-related contexts. Research and pedagogical materials related to aviation English have typically focused on the communication between pilots and air traffic controllers during all stages of a flight. This is because the International Civil Aviation Organization (ICAO) has established English as the international language of air traffic control. According to ICAO policy, pilots on international flights and air traffic controllers in airspaces that receive international flights must demonstrate the ability to communicate effectively in English, in addition to the language used by the station on the ground.

The language of air traffic control, also called radiotelephony, is distinct from many LSP domains, because it is used for a very restricted set of functions and has a prescribed phraseology with reduced syntax and vocabulary for routine actions. Furthermore, the communication occurs primarily via radio, with no face-to-face interaction between the pilot and the controller. It also involves extensive shared information concerning the aircraft in the area, the parameters of the airport or airspace, and the expected actions at particular points in the flight. Typically pilots have filed a flight plan that identifies the plane with its call number and indicates the destination and preferred route of the flight. They would have familiarized themselves with the codes and radio frequencies for various reporting stations along the route. The controller typically has access to the flight plan, as well as radar that visually tracks the various planes in the airspace. Most communications follow routine and established patterns, and the vast majority of the information conveyed is expected by both participants. However, air safety depends on the ability of aviation professionals to continually monitor the accuracy and effectiveness of all exchanges.

ICAO Standards

The prescribed language and discourse practices of aviation English are governed by professional standards and international policies developed by ICAO. Although there are some regional differences in aviation English across countries, most notably variations in language usage required by the US Federal Aviation Administration and the United Kingdom Civil Aviation Authority, ICAO standards are typically the focus of aviation English testing and curricula. In 2003, in response to accidents and incidents where the language proficiency of pilot and air traffic controller were causal or contributory factors, ICAO implemented more stringent English proficiency standards. The new standards emphasize the ability of aviation professionals to use what ICAO describes as a “dialect or accent which is intelligible to the aeronautical community,” to communicate in voice-only situations on “common, concrete and work-related topics,” and to use communicative strategies to exchange messages and to recognize and resolve misunderstandings, especially unexpected events within the context of a routine work situation (Mathews, 2004).

Communication Between Pilots and Air Traffic Controllers

The communication between pilots and air traffic controllers relates to the actions and situations that occur at specific points in an aircraft's flight. The major goal of this communication is to optimize the flow of air traffic while maintaining safety.

At the beginning of a flight all movement in the airport, including the movement of aircraft, service vehicles, and personnel, is monitored by air traffic controllers, who must communicate on established radio frequencies with a member of the flight crew of the aircraft. Aerodrome controllers ensure a smooth flow of traffic on the ground by providing instructions to aircraft for pushback from the gate, taxiing, holding, and takeoff. Ground control operations may be monitored by one set of air traffic control positions, while approach control operations, like takeoff and landing clearances, may be monitored by another set of controllers.

In order to illustrate the distinctive language of air traffic control, we provide examples from transcripts of authentic communication. The names of airlines, airspace, and reporting points have been altered. The pilot is indicated with a "P" and the air traffic controller with a "C" in this and all subsequent examples. Example (1) shows an exchange between a clearance delivery controller at the "Mountain City" airport and the pilot of Airline 819 prior to startup and pushback.

- (1) P: Clearance delivery. Airline eight-one-niner heavy at Bravo one-one with Delta, clearance Southern City
 C: Eight-one-niner heavy. Mountain City clearance delivery. Cleared to the Southern City Airport, Mountain City niner departure, then as filed. Maintain one zero thousand. Departure frequency will be one-two-tree decimal eight fife squawk zero six seven fife.
 P: Zero six seven fife. Airline eight-one-niner heavy.

In example (1), the pilot first indicates that he is contacting the clearance delivery controller. He then gives the call sign of his airplane ("Airline eight-one-niner"). In order to ensure clearer comprehension, letter and numbers are pronounced using the ICAO alphabet, which is also common to maritime and military contexts. Thus, "B" is read "Bravo," and "D" as "Delta." All numbers are pronounced as single digits; the number "9" is pronounced "niner," the number "5" is pronounced "fife," and the number "3" is pronounced "tree." The specialized pronunciation of certain numbers, though prescribed by the ICAO standard, is often not adopted by native speakers of English, who typically pronounce "3" and "5" in the usual "plain English" way. Note also that "decimal," not "point" is prescribed radiotelephony.

The pilot also specifies that the aircraft is "heavy." This indication alerts the air traffic controller that the aircraft is of the type that generates higher wake turbulence, which will affect the amount of separation that will be required between it and other aircraft. The pilot indicates his current location at the airport ("Bravo one-one") and that he has the Delta version of the Automatic Terminal Information Service or ATIS. ATIS is an automated broadcast of relevant information, including weather, active runways, and other notable information about hazards or special conditions. At busy airports, pilots are expected to listen to the most recent broadcast in order to reduce the information that the air traffic controller must provide. ATIS broadcasts are updated throughout the day with each broadcast labeled using the ICAO alphabet. The first broadcast is labeled Alpha, the second Bravo, the third Charlie, the fourth Delta, etc.

The next example illustrates an exchange between a pilot and an area controller. The area controller is charged with monitoring the progress of all the airplanes in flight within

a given altitude in a specified airspace. In example (2), the pilot contacts the area controller to inform him that she is at a specified reporting point, Sandford, which is on her flight path. After it reaches the position, the plane will be passed from the Canyon Controller to the controller for the next area, Vanna Control, and she must tune her radio to a new frequency, 123.7.

- (2) P: Bravo Tango Oscar one niner-eight-eight. Position Sandford.
- C: Bravo Tango Oscar one niner-eight-eight. Canyon Control. Roger. Contact Vanna Control one-two-tree decimal seven. So long
- P: Bravo Tango Oscar one niner-eight-eight. Vanna Control one-two-three decimal seven. So long.

The exchange in this example again models ATC (air traffic control) phraseology, with its prescribed number and letter readout format, limited syntax, and restricted vocabulary. It also illustrates the distinctive turn-taking identifiers for speakers and addressees. The pilot of the plane begins the exchange by identifying herself with the call sign of the plane, BTO1988. This identification ensures that the controller knows which plane in the airspace is calling in. The pilot then uses standard phraseology to report that she has reached the Sandford reporting point ("Position Sandford"). In his response, the controller repeats the call sign of the plane, indicating who the intended addressee is. Because there are usually multiple aircraft in the airspace and all are tuned to the same frequency, it is essential that all planes know to whom the controller's communication is addressed. The controller then gives his identifier ("Canyon Control"). Having thus established the intended addressee and himself as speaker, the controller acknowledges the information received ("Roger") and then goes on to give the aircraft the instructions for the next part of the flight. He tells the pilot to contact the next area controller ("Vanna Control") and provides its radio frequency ("one-two-tree decimal seven").

The signoff greeting ("So long") is not prescribed phraseology. It is an example of what in aviation is called "plain English." In general, ICAO standards prescribe the use of phraseology whenever possible, with the use of plain English reserved only for unexpected or unusual circumstances. However, both native and non-native English-speaking pilots and controllers regularly use "plain English" in their exchanges. Greetings are very common in ATC communication, indicating the opening and closing of interactions. Since in example (2) the controller is terminating contact with this aircraft, the use of an expression like "So long" or "Good day" is an effective indicator that this will be the final exchange. It is also common for pilots to use greeting expressions like "Buenas dias" or "Good morning" in their initial communication with a particular controller.

The exchange in example (2) concludes with the pilot starting her final turn by again giving her call sign and then doing a "readback" of the key information the controller has given, the identifier of the next area controller and the frequency. She then signs off. The readback is a key aspect of radiotelephony and should be a major focus for teachers and researchers of aviation English. The pilot is required to read back key information, and the controller must listen to that information carefully to ensure its correctness. If the information is incorrect, the controller must correct the pilot immediately. Example (3) shows such a correction.

- (3) C: Whiskey Juliet Alpha one-four-six-four. Radar service terminated. Maintain flight level three-niner-zero. Contact Vanna Control one-two-tree decimal seven. So long
- P: One-three-two decimal seven. Whiskey Juliet Alpha one-four-six-four
- C: Whiskey Juliet Alpha one-four-six-four. Canyon Control. Negative. That's one-two-three decimal seven.

4 AVIATION ENGLISH

The routine nature of the exchanges and the vast amount of expected information communicated sometimes leads pilots and air traffic controllers to “hear” an expected response rather than what was actually said. Some mishearings have led to unfortunate aviation incidents. For this reason, listening and clarification skills are essential for proficiency in aviation English. The controller in example (3) uses standard phraseology for a correction (“Negative”) but he adds a plain language phrase (“That’s”) to highlight the correction, in addition to placing stress on the corrected numbers (indicated in **bold**). Example (4) illustrates a common situation in which phraseology is mixed with “plain language.”

- (4) P: Canyon Control. Airline three-one-zero. We’ll need to deviate for weather about forty miles ahead.
C: Airline tree-one-zero. Roger. Confirm what side, left or right?
P: uh deviation uh left for weather in about uh probably start in about three-zero miles
C: Tree-one-zero. Canyon Control. Roger. Left deviation approved. After deviation fly direct to Cama.
P: Left deviation approved afterwards cleared direct to Cama. Airline three-one-zero
C: Tree-one-zero. Affirm.

Here the pilot of Airline 310 informs the Canyon area controller that he intends to deviate from the prescribed flight path because of bad weather. Although standard phraseology exists for such a request (“request weather deviation”), the native English-speaking pilot frames the request in plain language, “we’ll need to deviate for weather.” Since this request does not specify the direction of the deviation, the non-native English speaking controller requests a clarification, again using plain language, “what side, left or right?”

Example (4) highlights aspects of aviation English that are important for the LSP professional to understand. One such aspect is the controversy over the use of “plain language” instead of prescribed phraseology in routine exchanges. Many aviation professionals, particularly those who are non-native speakers of English, cite the unnecessary use of plain language as a factor that makes communication more problematic in international settings. On the other hand, all aviation professionals acknowledge the importance of using plain language to deal with unusual or unexpected circumstances. Such uses include the ability to confirm and clarify information, as seen in example (4), and the ability to use plain language questions in emergencies (“Are you dumping fuel?,” “Can you give me your souls on board and your fuel on board?”).

As the examples we have presented suggest, the prescribed language of aviation English uses a specialized and restricted vocabulary and syntax. Compared to many other LSP contexts, aviation English is unusual in the limitations it puts on syntactic variation. Most exchanges use the prescribed imperative form and the most frequent verb forms are the base form (*confirm*, *request*, *maintain*) and bare participles (*cleared*, *approved*, *terminated*). Auxiliary verbs occur only occasionally in plain language exchanges. However, the ability to adequately control auxiliary verbs to mark tense and ask questions can be critical in unusual emergency situations.

Recent research on aviation English has focused on developing curricula and language tests to meet the new ICAO standards. ICAO Document 9835 provides a thorough overview of the ICAO standards (ICAO, 2004). A number of discourse-based research studies have examined specific aspects of authentic aviation discourse (Linde, 1988; Goodwin, 1996; Sanne, 1999; Mell, 2004; Nevile, 2004; Wyss-Buhlmann, 2005; Hinrich, 2008). These are valuable sources concerning authentic aviation language. In addition, several recent studies have focused on testing aviation English (Alderson, 2009; Estival & Molesworth, 2009; Huhta, 2009; Kim & Elder, 2009; Moder & Halleck, 2009; Read & Knoch, 2009). These studies provide in-depth analysis of proficiency in aviation English and the sociopolitical contexts of assessing it.

Bachman, Lyle F.

ANTONY J. KUNNAN

Lyle Bachman has been one of the leading theorists in the field of language testing for the last three decades. He was born in Iowa, USA, in 1944 and received his BA, MA, and PhD (1971) in English, all from Indiana University. Although his PhD was in English literature, his dissertation was in second language acquisition, and was based on research he conducted with schoolchildren learning English in Thailand. After completing his PhD, he went to the University of Hawai'i as assistant professor in the Departments of English and Second Language Studies. After a year in Hawaii, he took up a position as project specialist with The Ford Foundation in Thailand, where he directed a large-scale longitudinal research and development project in individualized English language instruction for Thai elementary schools. It was while in Thailand that he developed an interest in quantitative research and language testing. In 1976, he took a position in Tehran, Iran as director of a joint University of Illinois–Tehran University project for developing ESP materials for university students. In 1979 he returned to the USA as assistant professor in the division of English as a second language at the University of Illinois, Urbana-Champaign. In 1989, he moved to the University of California, Los Angeles, where he has been since, as professor of applied linguistics teaching courses and seminars in language assessment, language program evaluation, research methods, and epistemology in applied linguistics, and directing student research projects in language testing. He has also held temporary appointments as chair professor and director of the English Language Teaching Unit at the Chinese University of Hong Kong (1994–6) and Fulbright fellow and visiting professor in the faculty of education at the University of Hong Kong (2008–9).

At the time of writing, Bachman had authored and edited 13 books, 35 journal articles and reviews, and 32 chapters in books. He is a frequent speaker at various academic and professional conferences and meetings, and at universities around the world; at last record, he had given 126 presentations. He has provided consultancies for over 60 university departments, government, nonprofit, and commercial organizations; a few of the prominent agencies include the National Research Council's Board on Testing and Assessment, Educational Testing Service, and the Center for Applied Linguistics in the USA, and the University of Cambridge ESOL Examinations in the UK, the University Grants Committee in Hong Kong, the Language Teaching and Testing Center in Taiwan, and the Academy for Continuing Education and Human Resource Management in Germany.

Bachman's major academic contributions have spanned the last 30 years. One of his major areas of interest has been the validity of language tests and validation as a process for not only supporting the interpretations of test scores, but also as a procedure for conducting research into the nature of language ability. His first series of publications in this area included (the first two with Adrian S. Palmer) "The Construct Validation of the FSI Oral Interview" published in *Language Learning* (1981b), and "The Construct Validation of Some Components of Communicative Proficiency" (1982), "The Trait Structure of Cloze Test Scores" (1982), and "Performance on Cloze Tests With Fixed-Ratio and Rational Deletions" (1985) all published in *TESOL Quarterly*. Two book chapters, "Convergent and Discriminant Validation of Oral Proficiency Tests" (Bachman & Palmer, 1979) and "The Multitrait-Multimethod Investigation Into the Construct Validity of Six Tests of Speaking

and Reading" (Bachman & Palmer, 1981a), and "The Construct Validation of Self-Ratings of Communicative Language Ability" (Bachman & Palmer, 1989), published in *Language Testing*, were all examples of empirical research in language testing using sophisticated techniques such as exploratory and confirmatory factor analysis. They also demonstrated to researchers that a theory of language proficiency could be tested with data using the factor analytic method. These empirical studies were followed by a series of more critical, interpretive studies in validity, including "The Evaluation of Communicative Language Proficiency: A Critique of the ACTFL Oral Interview," with Sandra Savignon (1986), published in *The Modern Language Journal*, "Problems in Examining the Validity of the ACTFL Oral Proficiency Interview" (1988), published in *Studies in Second Language Acquisition*, and "Constructing measures and measuring constructs: a discussion of the research into the nature of language proficiency conducted as part of the Development of Bilingual Proficiency Project" (1990a). His concern with issues of validity and the nature of the constructs we measure have continued with more recent publications, including, "Some Reflections on Task-Based Language Performance Assessment" (2002) and "What is the Construct? The Dialectic of Abilities and Context in Defining Constructs in Language Assessment" (2007).

These investigations into validation and the nature of language ability lead to a series of books, beginning with *Fundamental Consideration in Language Testing* (1990b) which explored these issues in depth. In this first book, he brought to the field Messick's unified view of construct validation, and combined his own concept of test method facets and communicative language ability, building upon Canale and Swain's conceptualization of communicative competence, to formulate a framework for guiding research and development in language testing.

This was followed by *Language Testing in Practice* (Bachman & Palmer, 1996), which applied research findings and theoretical notions to the practical development of language tests. In this book, he and Palmer elaborated the concepts of target language use and test usefulness (composed of reliability, validity, authenticity, interactiveness, practicality, and impact). The latter concept deconstructed Messick's unitary model of validity with the intention of providing practical guidance for test developers in evaluating the validity of score-based interpretations. In *Language Assessment in Practice* (Bachman & Palmer, 2010), he built upon and extended the work of Kane and Mislevy in educational measurement by applying Toulmin's practical argument structure to develop an assessment use argument as the central principal for guiding the development and use of language assessments.

Bachman's work has also made a contribution in the area of statistical analyses and research methodology. Through his empirical research he has demonstrated the usefulness of employing appropriate and sophisticated statistical techniques in the analysis of test content and test results. One of his empirical studies that has been particularly influential, in terms of methodology, is the Cambridge-TOEFL comparability study (Bachman, Davidson, Ryan, & Choi, 1995), in which he and his colleagues investigated the underlying traits of the two EFL test batteries by employing exploratory factor analysis. His book, *Statistical Analyses for Language Assessment* (2004) and the accompanying workbook (Bachman & Kunnan, 2005) attempt to make the tools of statistics accessible to both practitioners and researchers. In his most recent work, Bachman has explored issues in empirical research in applied linguistics. In "Generalizability: A journey into the nature of empirical research in applied linguistics" (2006), he traces the methodological differences in approaches to empirical research in applied linguistics to differences in the epistemological and ontological perspectives of researchers themselves, and lays out an analytic framework for characterizing and understanding these differences.

An additional contribution is Bachman's mentoring of a new generation of language testing researchers, earlier at the University of Illinois and now at the University of California,

Los Angeles. At last count, he had supervised over 30 doctoral dissertations; most of which employed concepts such as communicative language ability, test-method facets, test usefulness, exploratory and confirmatory factor analysis, structural equation modeling, and most recently, an assessment use argument. These studies have typically investigated the underlying traits of tests and the relationships among test-taker characteristics, test-taking strategies, test-method facets, test performance, and test use.

Bachman has received many awards and honors; they include the TESOL/Newbury House Award for distinguished research (1985), president of the American Association of Applied Linguistics (1988), two Kenneth Mildenerger Prizes for outstanding research publication in teaching foreign languages and literature from the Modern Language Association of America (in 1991 for his book *Fundamental considerations in language testing* and in 1997 for his coauthored book with Palmer *Language Testing in Practice*), president of the International Language Testing Association (1996), the Lifetime Achievement Award from the International Language Testing Association (2004), Distinguished Scholarship and Service Award from the American Association of Applied Linguistics (2010) and honorary professorships from the University of Shanghai for Science and Technology and the Guangdong Foreign Studies University.

Bachman's service to the field of language testing has been broad as well: he participated in a meeting of language testers during the TESOL Convention in Boston in 1978. This meeting was the genesis for the Language Testing Research Colloquium (LTRC) which has become the premier international conference in language testing, being held annually in different cities in the world. Bachman has been a co-organizer of LTRC many times in collaboration with colleagues (Adrian Palmer, Antony Kunnan, Bonny Norton Pierce, Jim Purpura, Nathan Carr, and Lianzhen He, to name a few). He was also the coeditor of the journal *Language Testing* and the coeditor of the book series *Cambridge Language Assessment Series* (both with J. Charles Alderson). The book series made available very useful titles on assessing different language use activities (listening, speaking, reading, and writing), components of language ability (grammar, vocabulary), assessing languages for specific purposes, assessing young learners, and assessing language with the use of computers.

Baetens Beardsmore, Hugo

OFELIA GARCÍA

I first met Hugo Baetens Beardsmore (1942) in New York City in the mid-1980s. He had come to meet with Joshua Fishman and others, but also to visit bilingual schools. Although I had learned much about bilingualism from Baetens Beardsmore's work and especially his *Bilingualism: Basic Principles*, it was his watch that impressed me most. I accompanied him then on a visit to a bilingual elementary school. There, Hugo sat in children's chairs, as children and teachers spoke Spanish and English. But he was wearing a special watch that he casually displayed for the children. Eventually they noticed and started asking questions. Baetens Beardsmore urged them on, speaking in English, as well as French and Dutch, each time showing them one more fascinating aspect of the special watch. And the children responded by not only speaking English and Spanish, but also by trying out words in his languages. Hugo did not shower the children with questions. Instead, he waited until they asked him questions to which he answered with thorough insights, important details, and yet humor. For me, it is this image of Hugo Baetens Beardsmore (or H.BB. as his students fondly call him) that has forever been imprinted in my memory—a giant able to adapt to small chairs, an intellectual able to have fun with children, a scholar and a profoundly humane person, a humble and engaging person. And precisely these are the qualities that have made Baetens Beardsmore's scholarly work so important, from the very early *Bilingualism: Basic Principles* (1982) to his recent contributions to *Bilingual Education in the 21st Century* (García, 2009).

Baetens Beardsmore was born in the small village of Hever, in Flemish Brabant in Belgium, and presently lives in Brussels. After his father was killed in the chaos that surrounded the end of World War II, his mother settled in England where he went to primary and secondary school. He received his PhD from the University of Wales at Aberystwyth, with a dissertation on the French of Brussels, and returned to Belgium to head the Department of English at the Université Libre de Bruxelles in 1968. When in 1970 the university was split into two linguistic entities, Hugo moved to the Vrije Universiteit Brussel, where he has been chair of the Department of Germanic Philology, Dean of the Faculty of Arts, and professor of English and Bilingualism, and where he continues to serve as emeritus professor. He is also a member of the Belgian Académie Royale des Sciences d'Outre-Mer, where he served as their president in 2001.

During his stellar career Dr. Baetens Beardsmore has published 13 books and over 150 scholarly articles. He has also written reports on education for the Council of Europe, the European Commission, the Ministry of Education of Brunei Darussalam, the education ministries of the Basque Country and Catalonia, and the State of California Department of Education. He is a much sought-after speaker, having lectured extensively throughout the world—in Europe in his native Belgium, but also in Bulgaria, Denmark, Finland, France, Germany, Great Britain, Italy, the Netherlands, Poland, Romania, Russia, Slovakia, Slovenia, Sweden, Switzerland; in Asia in Brunei Darussalam, China, Hong Kong, Indonesia, and Singapore; in the Americas in Canada, Mexico City, and the USA; and in the French island of La Réunion. He has also taught abroad; for example, he held the Peter Paul Rubens Chair at Berkeley. Baetens Beardsmore also serves on numerous editorial boards including the *Journal of Multilingual and Multicultural Development*, the *International Journal of Bilingualism*, and the *International Journal of Bilingual Education and Bilingualism*.

Bilingualism: Basic Principles (1982; 2nd ed. 1986), first published 30 years ago, has become a classic. It was the first book written for students of bilingualism. With clarity of style, and yet enormous erudition, Baetens Beardsmore presented the conceptualizations of the two pioneers in the field—Weinreich and Haugen—and then introduced the ideas of more contemporary scholars. But *Basic Principles* is also a visionary work. It was here that Hugo first wrote about the “obsession with monoglot norms of reference” (p. 10). In the last chapter, Baetens Beardsmore points out the difficulties that continue to plague bilingual students today. The nature of tests and measurements used with bilingual students are identified as the main culprits (p. 138); and Baetens Beardsmore warns that the Canadian model “may not solve all bilingual education problems” (p. 139). This last chapter sets him apart from other scholars of bilingualism in that he considers, alongside language development, the speakers’ identity development. He points out that bilinguals can experience what the pioneer French sociologist Durkheim had called *anomie* (1897), “a feeling of personal disorientation, anxiety and social isolation” (p. 126), if schools do not provide them with adequate support. For this reason, Baetens Beardsmore declares, “bilingual education should be paired with bicultural awareness” (p. 134).

It is this interest in bilingual speakers, and children in particular, that has marked the progression of Hugo’s scholarship from one that centered initially on linguistic descriptions to one that focuses on applied linguistics topics, and especially on bilingual learners. An early article, “Aspects of Plurilingualism Among Lower Level Social Groups” (1971), already used the term “plurilingualism” that was to be adopted 30 years later by the Language Policy Division of the Council of Europe to refer to the complex use of several languages. That article explored issues of bilingual development among poorer students. But Hugo was also interested in bilingualism for language majority children. Thus, in 1977 his “An Investigation into Bilingual Education for Children from Favoured Socio-Economic Backgrounds” appeared. And in 1979, he published his “Bilingual Education for Highly Mobile Children.” This is indicative of his insistence, prevalent throughout his collaboration in *Bilingual Education in the 21st Century* (García, 2009), that bilingual education is for *all* children—minorities and majorities.

This interest in bilingualism for all is a theme that Hugo has developed especially in his work on European schools, and in his recent work on CLIL/EMILE (content and language integrated learning/enseignement d’une matière intégrée à une langue étrangère), the French acronym added by Baetens Beardsmore as a reminder of Jean-Jacques Rousseau’s treatise on education. His scholarly production on European schools started in 1979 and has continued in the last 30 years. In so doing, Baetens Beardsmore has reclaimed a place for the European contribution to bilingual education, distancing it from the Canadian immersion models. With Merrill Swain, Hugo drew differences between the Canadian models of bilingual education and those of Europe in their jointly authored 1985 article. Hugo makes the claim that the explicit language instruction in European schools results in more bilingualism and biliteracy than the implicit language instruction of Canadian immersion programs. His efforts to make intellectual space for European models of bilingual education, in an era that was clearly dominated by North American scholarship emanating from Canada and the USA, culminated in his edited book, *European Models of Bilingual Education* (1993).

In 2007, Baetens Beardsmore co-edited (with Do Coyle) an issue of the *International Journal of Bilingual Education and Bilingualism* devoted to research on CLIL/EMILE. CLIL was a way of bringing together some of the aspects of bilingualism in education that he cared for deeply. As he stated in a 2009 intervention at the International Association of Teachers of English as a Foreign Language (IATEFL), CLIL moves language education out of the isolation of the traditional language class and into the whole school. By using the other language for content instruction, CLIL makes that language immediately pertinent

for the learner. The collaboration between language teachers and content teachers means that students benefit from the focus on accuracy of language teachers, alongside the greater interest on understanding subject matter of content teachers. Thus, unlike Canadian immersion programs where the emphasis is on the production of natural speech, CLIL classrooms also pay attention to precision within the context of fluent exchanges and connected discourse in speech and writing. In CLIL programs, all teachers incidentally become language teachers.

Although a world traveler, Hugo Baetens Beardsmore has never abandoned his interest in the language of Brussels, an interest he has held since his dissertation days and the early publication of *Le français régional de Bruxelles* (1971), as well as in the multilingualism of his native Belgium. Besides important sociolinguistic articles on language contact in Brussels, Hugo has also written on macro sociolinguistic issues such as language and television in Brussels. Moving outwardly from Brussels, he has authored articles on triglossia in Flemish Belgium (1979), and language planning in Belgium (1987). Although his focus is Belgium, evident from the greater number of articles and contributions on the country, Hugo has also written on multilingualism and education in Luxembourg, Brunei Darussalam, Hong Kong, Indonesia, and Singapore.

Hugo Baetens Beardsmore recently collaborated with me on our book *Bilingual Education in the 21st Century*. From the beginning he insisted on what became the main thesis of the book: that bilingual education is *the only way* to educate children today. He pushed me gently whenever he felt I was deviating from a generous stance that included all children, both language majorities and language minorities. He kindly provided information—about Europe, but also about Asia, and even the USA. He showed me how to collaborate in selfless ways, insisting that his name not appear as co-author, even though his contributions deserved it. Baetens Beardsmore's erudition is deep; his insights are fresh and surprising. But it is perhaps his sense of humor that makes him such an accessible and committed scholar, opening up spaces that allow for innovation and fresh insights. When my husband and I recently visited him in his home in Brussels, Baetens Beardsmore told us the history of a fine portrait dating from 1633 that hangs in his sitting room, that of Lady Arabella, one of his ancestors. Of course, the portrait turned out to be one that he had bought as a student, but in his story of Lady Arabella there hangs a tale about Baetens Beardsmore's legacy; one of serious scholarship that questions conventional reality and treats traditional monoglot interpretations as myths and legends. Baetens Beardsmore's scholarship, then, is characterized by an attachment to scientific rigor coupled with an imaginative creative approach that enables him to give pride of place to what is otherwise often hidden from view, naming and exploring a heteroglossic plurilingualism in both society and education.

Baker, Colin

W. GWYN LEWIS

Colin Ronald Baker, widely acknowledged as one of the most perceptive leading international scholars in the field of bilingualism and bilingual education, was born on October 1, 1949 to a monolingual English family in Danbury, Essex, southeast England. Having attended the local primary school in Danbury and King Edward VI Grammar School in Chelmsford, he crossed the border to Wales to receive his higher education at Bangor, a university that specializes in bilingualism and which is situated in a city in the heartland of Welsh-speaking Wales where the indigenous population is fluently bilingual in English and Welsh. He graduated with First Class Honors in Educational Studies before obtaining his PhD in Social Psychology. One of his influential tutors at Bangor was W. R. Jones, who had a worldwide reputation for research and writing on bilingualism and intelligence, language attitudes, and the effectiveness of bilingual education, and so the seeds were sown for Baker's distinguished career in this particular field.

Having taught for three years in secondary schools in England, specializing in mathematics and music, as well as children with special educational needs, Baker returned to Bangor University in 1977 as a lecturer in Education before being awarded a professorship (a personal chair of the University of Wales) in 1994, together with a fellowship of the British Psychological Society in the same year. At present he is Pro-Vice-Chancellor (Teaching and Learning) of the University, and Co-Director of the prestigious Economic and Social Research Council (ESRC) Centre for Research on Bilingualism in Theory and Practice at Bangor. The high esteem by which he is also held outside the academic world is reflected in the fact that he has been invited to take up a number of government appointments in Wales. He was a founder council member of the Welsh Curriculum and Assessment Authority and between 1997 and 2007 he served on the Welsh Language Board, a statutory language planning organization sponsored by the Welsh Assembly Government and established in 1993 under the terms of the Welsh Language Act to promote and facilitate the use of the Welsh language in Wales. In 2010 he held a consultancy role with the Welsh Assembly Government in respect of their bilingual services.

It was as a young student in Bangor that Baker met his future wife, Anwen, a local girl from a fluent Welsh-speaking family, which was to have a very positive influence on his career. They have three fully bilingual children and were it not for this bilingual nuclear and extended family, he might never have written so extensively on bilingualism and bilingual education. By his own admission, living in a bilingual household has provided him with the experience, the stimulus for thinking, and a homely "feet on the ground" dimension that balances the academic study of bilingualism. Since 2005, being a grandfather has also allowed him to take a different perspective on childhood bilingual development (Baker, 2007, p. xiii).

The publishing of Baker's first book, *Aspects of Bilingualism in Wales*, in 1985 with Multilingual Matters was to herald a very successful and fruitful relationship between himself and his publishers that has spanned over 25 years. To date, he has over 150 publications, including 15 books and over 50 articles or book chapters on bilingualism and bilingual education, with specific interests in language planning and bilingual education. He has given invited keynote lectures at various academic institutions across the world,

including City College New York, the State University of California at Long Beach, the University of Pittsburgh, and The Autonomous University of the Basque Country. He has also presented papers to a high-level Irish government meeting of Language Planning organizations, and to the European Union Regional and Minority Languages in Education Systems Conference in Brussels.

Colin Baker is in the rare position for a UK academic of commissioning the most prestigious scholarly publications in his field from international authors, particularly from the USA, with whom he is clearly identified as one of the leading international scholars. He was the founder editor (1994) and now coeditor of an international series of academic books on *Bilingual Education and Bilingualism* with Nancy Hornberger, University of Pennsylvania, a much valued colleague with whom he has worked closely for many years and who has influenced his approach to biliteracy, language planning, and qualitative research. He is also the founding and sole editor (1997) of the *International Journal of Bilingualism and Bilingual Education*. Under his editorship, this journal has been so successful that it has tripled in size, moving from four issues of 80 pages to six issues per year with 128 pages in each issue. He also serves on the editorial boards of the *Journal of Multilingual and Multicultural Development*, *Language and Education*, the *Journal of Language, Identity and Education*, the *Bilingual Research Journal*, *Evaluation and Research in Education*, and the *International Journal of Multilingualism*.

It is widely recognized that Baker's most influential and highly acclaimed book is *Foundations of Bilingual Education and Bilingualism* (1993a; fifth edition, 2011). It has sold over 60,000 copies and been translated into Japanese, Spanish, Latvian, Greek, and Mandarin. The first edition won the 1994 UK Standing Conference in Education Book Prize (for the best book of 1993 by an established author). This scholarly book was the first to integrate international and interdisciplinary research on bilingualism and bilingual education. In the USA, it continues to be one of the most widely read texts on theory and research on bilingualism and bilingual education, with further high sales in most countries of Europe, Canada, Japan, and other Pacific Rim countries—all areas with a crucial and growing interest in bilingualism, multiculturalism, and bilingual education. Ever since the first edition was published in 1993—with its typology of bilingual education distinguishing between “weak forms” and “strong forms”—*Foundations* has defined the field of bilingual education by comprehensively conceptualizing its philosophy, politics, policies, provision, and diverse practices. Another feature of this invaluable text is that it has been consistently updated to include the most recent salient research findings. Two early associations influenced the writing of what has become a classic in the field: first, the Managing Director of Multilingual Matters, Mike Grover, wrote to Baker in 1990 asking him to consider writing the definitive textbook on bilingual education; second, Ofelia García (currently Professor of Urban Education at the Graduate Center of the City University of New York) was appointed as academic consultant for the first edition of the book. García remains one of Baker's most respected colleagues and in her recent book, *Bilingual Education in the 21st Century: A Global Perspective* she pays tribute to his insightfulness and accomplishments by claiming that “no other book on bilingual education has been more influential to my students and to myself than his *Foundations*” (García, 2009, p. xiv).

In 2000, Baker was honored with the California Association for Bilingual Education Special Recognition Award for Research and Scholarly Activity for his “leadership in cutting edge research and for co-authoring the *Encyclopedia of Bilingualism and Bilingual Education*, a powerful resource in the minority community.” The 758-pages long *Encyclopedia*, written with Sylvia Prys Jones in a three-year period, and published in 1998, also won the British Association for Applied Linguistics Book Prize Award for 1999.

Not only is Baker considered one of the most discerning scholars in the field of bilingualism and bilingual education, but he is also highly respected for the way in which he applies his research and scholarship in a practical way so that parents and professionals

can take advantage of his vast knowledge and expertise. His clarity and simplicity of style makes his work accessible and user-friendly to a wide audience who come across bilingualism in the course of their everyday lives and he is regularly called upon to address parents and to contribute to media presentations in Wales. Two key texts of his have made a substantial contribution in addressing some of the issues and concerns of today's bilingual families and practitioners. The first, published in 1995, was *A Parents' and Teachers' Guide to Bilingualism* (2007, now in its third edition and also published in Swedish in 1995 as *Barnets Väg Till Tvåspråkighet* and subsequently in Spanish, Mandarin, Estonian, Turkish, and German) and the second is *The Care and Education of Young Bilinguals: An Introduction for Professionals* (2000). Both books are written in a straightforward and easy-to-read format, providing a comprehensive and practical overview of bilingualism for those involved with the day-to-day practicalities of raising children bilingually and who are looking for concise answers to a variety of frequently asked questions.

In 2007, alongside Margaret Deuchar and Ginny Gathercole, Baker was pivotal in attracting five million pound funding to Bangor University for establishing the ESRC Centre for Research on Bilingualism in Theory and Practice (<http://www.bilingualism.bangor.ac.uk>), the first research center in the UK to focus specifically on bilingualism. The main practical focus of this center is the implications of interdisciplinary research findings for bilingual language policy, planning, and implementation, based around five research groups. Four major research projects undertaken by the Bilingual Education Research Group, led by Baker, focus on Welsh-medium and bilingual development in Wales across different age ranges, encompassing preschool settings, primary and secondary education, higher education, and the teaching and learning of Welsh as a second language among adult learners. Although Welsh-medium and bilingual education has flourished and developed in Wales for nearly 70 years—and taking into consideration that “no existing typology of bilingual education in Wales captures the full kaleidoscope of colours that exist” (Baker, 1993b, p. 15)—these research projects will be a first at aiming to comprehensively define and analyze various teaching and learning methodologies and different models of bilingual education in a country that shares the international leadership of bilingual education policies and practices. Being actively involved in such innovative research within this center is aptly regarded by Baker as the high point of his career to date.

Bakhtin and Second Language Acquisition

HANNELE DUFVA

One cannot study grammatical forms without constantly considering their stylistic significance. When grammar is isolated from the semantic and stylistic aspects of speech, it inevitably turns into scholasticism. (Bakhtin, 2004, p. 12)

It may be considered a small miracle that a philosopher like Mihail Bakhtin (1895–1975) now enjoys a reputation that can be called a boom. Bakhtin lived during troubled times, and there have been many controversies around him and his work. Born in Czarist Russia in 1895, young Bakhtin was influenced by German idealist philosophy; still, after the Russian revolution he worked in close cooperation with friends and colleagues many of whom were Marxists. During the Stalinist era, most of Bakhtin's life was spent in places far removed from the leading circles of Soviet academic life, and his academic career was not high-ranking. He worked at the Pedagogical Institute in Saransk where he was a much-liked teacher, but his doctoral thesis was not accepted until 1952—after a series of difficulties and postponements. There have been disputes about the authorship and even potential plagiarism around his works. He was not a lonely genius; the dialogical ideas were inspired by the intellectual atmosphere of the early Soviet era and developed in cooperation with the circle of colleagues now commonly known as the Bakhtin Circle. The most important of these friends is perhaps Valentin N. Voloshinov (1895–1936). All things considered, Bakhtin is undoubtedly a foremost pioneer of dialogical thinking and also one of the key figures in the contemporary discussion on language and mind.

For some time already, Bakhtin has been quite well known in some areas of applied linguistics, particularly in those that deal with texts, intertextuality, literacy, or genres, but now also his potential contribution to SLA is becoming acknowledged (Hall, Vitanova, & Marchenkova, 2004). However, as Bakhtin probably considered himself primarily a literary scholar and philosopher of language, his interests were not directly focused on second or foreign language learning. While he actually wrote one article on language education—where he discussed the role of stylistics in language teaching (Bakhtin, 2004)—it is evident that a contemporary discussion in the context of SLA needs to go beyond what Bakhtin himself wrote and that his arguments need to be recontextualized. Although Bakhtin's work is particularly useful for its theory of language and its philosophy of communication, there are many new developments—theoretical frameworks and research methodologies—that seem to be commensurable with his arguments and that help us further understand the nature of language learning.

What is it that makes Bakhtin's ideas—or, dialogism—so attractive today? One reason is probably just the way in which the Bakhtinian tones resonate with the contemporary approaches that have sprung up since the “social turn” in second language acquisition. Dialogism is a theory that certainly foregrounds the social elements: it argues for the view that both human language and human awareness emerge in social activity. Its chosen focus in the analysis of language is social as well: both Bakhtin and Voloshinov pointed out that language needs to be studied in its concrete social and cultural contexts. It is thus not

surprising at all that one of the first mentions of Bakhtin in the context of Western language-learning research was made by Courtney Cazden (1989) who pointed out the similarity between Dell Hymes' work and the ideas of Bakhtin and Vygotsky. It is above all the socially and culturally oriented traditions of linguistics that first found Bakhtin.

Thus Bakhtin's ideas were introduced in the Western context as an alternative for the almost exclusively cognitive orientation of early SLA, which until the 1990s had been strongly influenced by Chomskyan linguistics and cognitive psychology. Hitherto, second or foreign language learning had been regarded as an individual process of acquisition that was taking place "in one's head." Hence, social factors and events had had a secondary or auxiliary role only. The methodologies had been almost exclusively experimental. However, since the 1990s, to study language across various social contexts and to develop methods suitable for mapping the social reality has been one of the main concerns of both applied linguistics in general and SLA in particular. Dialogical thinking can add to this a view of language use as a sociocognitive and intersubjective event.

Many contemporary researchers coming from the socially or culturally oriented research traditions (or both) share some arguments with dialogism and often also refer to Bakhtin. Theoretical and methodological frameworks that have in some way embraced Bakhtinian arguments and which also involve language learning include, e.g., language socialization, ethnomethodology, linguistic anthropology, conversation analysis, interaction studies, and ethnography. Most often perhaps, dialogism is combined with sociocultural thinking (Johnson, 2004; Lantolf & Thorne, 2006) and activity theory (Wells, 2002). In a way, contemporary researchers seem to be answering to Bakhtin's and Voloshinov's appeals for a linguistics that would focus on examining actual language use.

While our knowledge of language use at the social level increases and as we have detailed descriptions of language use in various types of situation, there also seems to be a growing understanding that language learning somehow occurs as a "side effect" of social activity by processes such as alignment (Atkinson, Churchill, Nishino, & Okada, 2007). This observation, however, brings us to the second cornerstone of dialogical thinking. While regarding social language use as a primary focus, dialogism does not limit itself to the study of the social, external context alone. Instead, the dialogical approach considers the social and the cognitive aspects as coexisting and coemerging and is thus a sociocognitive view (Dufva & Alanen, 2005).

A stand which aims at intertwining the personal (that is, psychological or cognitive) world of individuals with the social one is typical of dialogism. Bakhtin's arguments indicate that our understanding of who we are and what we are like emerges socially and dialogically in interpersonal relationships (Bakhtin, 1986, p. 167) but he also points out that each person has a particular, unique position and thus a perspective and a true sense of self (Bakhtin, 1993), which also contributes to the particular *voice* of the person (Wertsch, 1991).

Using a slightly different formulation, Voloshinov (1973, pp. 35–9) observes that language use is a continuous interplay that involves both social and individual aspects. That is, the ideologies of the social world and the experienced perspective of each person are present whenever people use language. Thus to engage in a conversation, for example, means that what is personal becomes public, and what is public becomes personal. Put in another way, in using language we each adopt the other's words and make them our own (Bakhtin, 1986, p. 143), a view that is also important for studying language learning. Dialogical thinking indicates that it would be just as big a mistake to study language use—and language learning—exclusively from a social, external point of view as to study it from a purely cognitive perspective. The dialogical sociocognitive argument suggests a research focus where both are considered.

The relationship between cognitive-level phenomena and social-level phenomena can be seen, for example, in language learners' beliefs. Dialogical analysis argues that beliefs

are of social origin and carry ideologies (e.g., language attitudes), but are also based on personal experiences (involving, e.g., language learner identities; Dufva, 2003). Both social and individual aspects contribute to the learners' voices (Aro, 2009). The dialogical, socio-cognitive approach can also be applied to the analysis of interaction with the aim of exploring how cognitive events intertwine with observable social behaviors and events. An example is Suni's (2008) study of non-native-native-speaker conversation where she showed how social interaction functions as a shared cognitive working space in which the native speakers' resources are made available for the non-native speakers' cognizing.

If asked to put the Bakhtinian idea of language learning in a nutshell, one could say that learning does not occur in a person's head nor in the social interaction but in the dialogues that take place within the system that consists of the learners and their environment(s) (van Lier, 2004). In the dialogical approach, language learning does not mean that a certain piece of information is transferred from a source A to a source B (Rommetveit, 1992). Rather, learning means that some sort of change is achieved in the ways a person is able to use language. Learning may mean that language users will be able to expand their repertoire but also will drop inappropriate behavior. It may suggest that they will be able to accomplish something in a more skilled manner, or will be able to express something in a variety of ways. In this, language learning is a continuous dialogue.

Because the starting point of dialogism is social it suggests that the examination of language learning begins with examining the particular social environment where learning is supposed to take place. Thus, one needs to study the activities and events that are present there—whether it be the formal context with its pedagogical practices and classroom interaction or the informal one with its everyday usages. However, in order to truly explain learning one should not stop there but continue speculating on how the cognitive and the social are intertwined in these particular contexts and activities (Platt, 2005) and how learners' voices develop and are recognized (Dysthe, 1996; Ohta, 2010). At present, there are many research methods and analytical tools that have turned out to be successful in analyzing language use at the social level and that are helpful for dialogical analysis as well. It is clear, however, that new theoretical openings and novel research methods are needed to analyze the hidden, cognitive aspects of these socially observable processes.

Further, the contemporary discussion of second and foreign language development needs to reconsider its theory of language. In this the dialogical arguments are most helpful. The picture that Bakhtinian thinking paints of language is rather different from the portrayal given by the mainstream linguistic thought of the 20th century. Dialogical arguments present a challenge to the Saussurean view but also to Chomskyan mentalism, both of which can be seen as representatives of what Bakhtin called monologism.

First, Bakhtin and Voloshinov themselves felt that it was important to analyze language as it actually is used in talk or writing. They did not aim at analyzing the underlying reality of language—as both Saussure and Chomsky would have done—but judged that what we see and hear in language use is more or less the true picture of language itself. Second, the dialogical theory of language is functionalist in character and, hence, a perspective opposite to formalism. Both Bakhtin and Voloshinov argued that the meaning-making nature of language is its primary feature and should duly be seen as the starting point of linguistic analysis. Thus, although the way in which language organizes itself into various forms and structures certainly does matter, this formal aspect is secondary and follows from the primal purpose of human language to act as a medium of meaning-making. Third, the dialogical view of language highlights its dynamicity. In this, dialogism presents an alternative to Saussurean emphasis on invariance.

Let us have a look at what the two theories of language—monological versus dialogical—might mean in the context of language learning. If the monological assumptions of

theoretical linguistics are transferred to applied linguistics and SLA, one consequence is that language learning is seen as a process of internalizing formal knowledge, for example grammatical rules and lexical items. Another consequence is that the knowledge is often represented in a decontextual fashion: language knowledge is detached from the actuality of situated language usages. In this way, the object of language learning becomes identified with memorizing the formal description of language: a grammar, or a list of words. Here, dialogical thinking suggests a different solution.

The Bakhtinian theory assumes that *utterance* is the basic unit of language. However, in calling utterance a unit, one has to observe that it is above all a functional and dialogical unit. First, as Bakhtin (1986, p. 71 & pp. 125–6) notes, utterances always belong to a speaking personality, are addressed to somebody (either to a concrete recipient, or a more abstract addressee), and seek a response from somebody. This means that language use is characterized by other-orientedness. Utterances are part of continuous, ongoing dialogues that refer both to the past (what has been said) and to the future (to the potential response). At the same time, the fact that utterance is a unit related to language use and interaction seems to be another way of saying that all language use is meaningful. When language use is regarded from a dialogical point of view it is not a formal exercise: As utterances are directed to somebody and await response from someone, they are also necessarily *about* something and exist for a purpose.

Further, language is used differently in different contexts: there are “relatively stable types” of utterances that can be called speech genres (Bakhtin, 1986, p. 60). Heteroglossia, the much quoted Bakhtinian concept, indicates that any speech community is characterized by diversity in its use of language (Bakhtin, 1981, pp. 262–3). Language use varies across contexts and situations and also changes and develops over time. Therefore, the Bakhtinian emphasis on taking concrete language use as the starting point of linguistic analysis also suggests that there is no single unified or monolithic language. If concrete language use is heteroglossic, it follows that *language itself* incorporates the multitude of different usages that can be called dialects, variants, registers, modality-specific usages, learner language and so on.

Thus the Bakhtinian formulation is a highly dynamic view of language—a view in which language constantly seems to regenerate and transform itself. This concept is very different from the definitions of language that were typical of theoretical linguistics and second language learning and teaching literature prior to this century. Interestingly, however, Bakhtin’s observations are similar to those made today by authors who argue that the traditional concept of *a* language is a social and cultural construct, an artifact that is closely tied to such issues as literacy or ideology of nation-states (Makoni & Pennycook, 2007).

Also in the context of second and foreign language learning, one needs to ask whether there is such a thing as *a* language, or, is there just *communicative activity* to be learned (Thorne & Lantolf, 2007). Or, can language learning be seen in terms of appropriation and use of different *linguistic/semiotic resources*? Or, is there just a continuous process of *language-ing*? Bakhtinian notions are compatible with those contemporary approaches where the understanding of language is expanded beyond the traditional view of linguistics (roughly: language as lexicogrammatical system) and also beyond the national language ideology (roughly: language as a monolithic national entity).

Considering second language acquisition and second language pedagogies in particular, it seems that languages are still often understood as monological and monolithic entities. First, the object of learning is often spoken of in terms of *a* language—“English” or “Spanish.” Second, this seems to involve the idea that in principle one can learn a language—in its entirety. Third, the notion is involved that one learns this particular language by internalizing its grammar and an amount of lexical elements. However, the Bakhtinian theory suggests a different view. Instead of learning one single “English,” people may learn very different “Englishes.” Instead of internalizing “grammars,” they may appropriate situated

usages that differ in their modality, register, genre, purpose, and so on. Instead of learning a language in its (supposed) entirety, each learner develops individual competences that vary across purposes, modalities, and situations and that are, by definition, always partial.

What we have then is two competing theories of language. One represents language as an elegant formal system that can be—in principle—acquired in its totality. The other theory of language—the dialogical one—regards it as a dynamic system that keeps itself on the move, has only situated rules, and never can be learned in its entirety. Aptly, Voloshinov (1973, p. 81) compared first language learning to entering “upon the stream of verbal communication.” The stream of communication is a metaphor that speaks of the dynamicity and fluidity of language use and also suggests a more dynamic metaphor for learning. Here, the concept of *participation*, commonly used in the second and foreign language learning literature today, would seem to be useful. Thus second and foreign language learning would refer to the processes by which beginners learn to participate in the social practices typical of each language community, thus *appropriating* their usages.

Dialogism is a theory hard to present in a short summary. Nevertheless, it can be argued that it is potentially highly useful for such pragmatically involved fields as applied linguistics and SLA. It is inherently contextual in its approach to language and it seeks to understand how various social and cultural factors either provide affordances or set constraints for the learners. Dialogically oriented language learning research asks questions such as who is learning the language, where, when, with whom, for what purpose, by what means, and what societal and ideological forces are at play (Kostogriz, 2005). But being sociocognitive in character, dialogism also entails the view that the research agenda needs to recognize the experiences of learners and listen to their *voices* as research participants. However, the sociocognitive approach logically leads beyond that—to the reanalysis of the cognitive world and cognitive processes of language learners. To summarize, a look back into history—into the arguments the Bakhtin Circle members presented quite a while ago—may turn into a look toward future developments in 21st-century second and foreign language research.

Bakhtin, Mikhail M.

LOTHAR BREDELLA

Mikhail M. Bakhtin (1895–1975) has become a dominant figure in various disciplines. In the introduction to *The Bakhtin Reader: Selected Writings of Bakhtin, Medvedev and Voloshino* Pam Morris writes: “His ideas are being utilized not just in literary studies but also in philosophy, semiotics, cultural studies, anthropology, feminist and postcolonial studies, Marxism, ethics, and of course Russian and Slavic Studies” (Bakhtin, 1994a, p. 1). He also had a strong influence on areas like linguistic discourse studies and qualitative socio-linguistics. His thoughts on heteroglossia and the importance of voice had a lasting effect on literary studies and linguistics. His influence is also dependent on *Marxism and the Philosophy of Language*, which was published under the name Voloshinov (for the debate about the authorship of this book, see below).

Bakhtin was born in Oryol (Orel), Russia, near Moscow. As a child he was educated at home by a German governess and as a result grew up bilingual. His father’s work as a bank manager took the family to many different cities, hence he attended secondary schools in Vilnius and Odessa, in which several languages were spoken. In 1914 he registered in the classics department at St. Petersburg University, but in the spring of 1918 he moved out to the countryside to escape the chaos that followed the outbreak of the revolution. In Nevel and Vitebsk (from 1919 to 1924) he was a member of a small group of intellectuals who discussed and wrote about such areas as philosophy and literature. From 1924 to 1929 he wrote most of the books which laid the foundation for his later reputation but were not recognized at the time. In 1929 he was arrested and exiled to Kazakhstan but was saved from a labor camp through the influence of his friends. His exile came to an end in 1934 but he remained in the country where life was easier than in the big cities. In 1937 he was able to escape arrest by fleeing to Savelovo, a town on the Volga. After World War II he became a professor of “Russian and world literature” in Saransk. In the 1960s he gained fame after the second edition of the Dostoevsky book (1963) and the publication of the Rabelais book (1965) in Russia. In the 1980s *The Dialogic Imagination* (1981) made him famous in many other countries. Holquist (2004, p. xiii) declares that from now on, as a consequence, Bakhtin “has become a necessary point of reference for serious students of literature around the world.” But this fame also led to different interpretations of his work. For Holquist (p. 28) *dialogism* is the central idea in his work. Dialogism posits the importance of the other in understanding oneself: “I see my self as I conceive others might see me. In order to forge a self, I must go outside” (Holquist, 2004, p. 28). With his concept of dialogue Bakhtin intends to overcome the dichotomy between objectivism and subjectivism and to gain a new concept of truth: “Truth is not born nor is it to be found inside the head of an individual person; it is born *between people* collectively searching for truth, in the process of dialogic interaction” (2009, p. 110).

There is a debate concerning the authorship of certain books which were published under the names of Medvedev and Voloshinov, since Bakhtin claimed that he himself wrote them (see Gardiner, 1992, p. 2; Holquist, 2004, p. 8). P. Morris is of the opinion that “the texts themselves are the only hard evidence we have, and, more importantly, they are what really matters” (in Bakhtin, 1994a, p. 4), and that the fact is that these texts are in accordance with Bakhtin’s basic ideas. They criticize formalism and structuralism because

they are unable “to account for the two most fundamental aspects of language: its active creative capacity and the always evaluative nature of meaning” (Morris in Bakhtin, 1994b, p. 4). The critique is argued in *Marxism and the Philosophy of Language*, which helps us to understand the central idea of Bakhtin’s aesthetics and his concept of answerability. Voloshinov/Bakhtin criticizes *individualistic subjectivism* and *abstract objectivism*. The former regards language use as a creative act of speech in the individual psyche; the latter considers language to be a system that is beyond the influence of the individual psyche such that “language is an objective fact external to and independent of any *individual* consciousness” (Bakhtin, 1994a, p. 31). Both concepts fail to explain what we experience in producing and listening to utterances: “In actuality, we never say or hear *words*, we say and hear what is true or false, good or bad, important and unimportant, pleasant or unpleasant, and so on. *Words are always filled with content and meaning drawn from behavior or ideology*” (1994a, p. 33). For Voloshinov/Bakhtin, language cannot be separated from behavior and ideology, hence we must take the context of an utterance into account: “Any utterance—the finished, written utterance not excepted—makes response to something and is calculated to be responded to in return” (1994a, p. 35). The critique of abstract objectivism and of individualistic subjectivism remains as relevant as it has ever been. Deconstruction in literary criticism treats utterances as if they were part of language as a system. Hence deconstructionists conclude that we do not speak the language but are spoken by it and are the victims of language. But the opposite position, the dominant postmodern constructivism with its emphasis on self-creation, is also insufficient because it assumes that meanings are produced in the individual or collective psyche and can be imposed on others (see Bredella, 2010, pp. 56–68).

Bakhtin’s concept of answerability is based on his insight into the dialogical nature of language, enabling him to overcome formalist aesthetics which regards the work of art as autonomous and which erects an unbridgeable gulf between aesthetics and ethics. In *Art and Answerability* Bakhtin (1990, p. 1) writes: “I have to answer with my own life for what I have experienced and understood in art, so that everything I have experienced and understood would not remain ineffectual in my life. But answerability entails guilt, or liability to blame. It is not only mutual answerability that art and life must assume, but also mutuality to blame.” Whereas formalism separates art and life and demands from us that we bracket our views and values, Bakhtin stresses that we respond with our views and values so that the work of art can change us: “a pure projection of myself into the other, a move involving the loss of my own unique place outside the other, is, on the whole, hardly possible; in any event it is quite fruitless” (Bakhtin, 2007, p. xiii).

How must the relationship between the work of art and the world we live in be conceived in order to bring about answerability? For Bakhtin the two worlds must be different: “We must never forget this, we must never confuse—as has been done up to now and as is still even done—the *represented* world with the world outside the text (naïve realism)” (1994b, p. 253). This difference between the two worlds is the presupposition for gaining a new perspective and a critical distance from our own world. However, we must not erect an unbridgeable gulf between the two worlds. The aesthetic experience is based on an “uninterrupted exchange” between the two worlds, “similar to the uninterrupted exchange of matter between living organisms and the environment that surrounds them. As long as the organism lives, it resists a fusion with the environment, but if it is torn out of the environment, it dies” (1994b, p. 254). It is the failure of objectivism and subjectivism that they both separate what is essentially interdependent and dialogical: “Art and life are not one, but they must become united in myself—in the unity of my answerability” (Bakhtin, 1990, p. 2).

Bakhtin finds in Dostoevsky’s novels “a plurality of consciousnesses, with equal rights and each with its own world” (2009, p. 6) so that the characters are no longer under the

control of the author or narrator. In his introduction to *Problems of Dostoevsky's Poetics*, W. Booth points out that Bakhtin has made us aware of the fact that in Dostoevsky's novels each main character is allowed to develop his or her freedom independently of the novelist's ideology (see Booth in Bakhtin, 2009, p. xxii). In like fashion, Bakhtin would point out the agency of individual language users to use language to select and design themselves within a dialogic system of communication.

Bamberg, Michael

LUKE MOISSINAC

Michael Bamberg (1947–) is coeditor of the journal *Narrative Inquiry* through which he supports and encourages theorizing and research into narrative from differing perspectives. In addition, he is the series editor of *Studies in Narrative* consisting of a series of books at the cutting edge of narrative research. Michael Bamberg has been an important figure in the promotion of a series of different genres of applied linguistic and narrative research. From his dissertation work on the acquisition of narratives by young children (Bamberg, 1987), through positioning theory (Bamberg, 1997a, 2003) and analysis of narratives (Bamberg, 2011b, 2012), to identity construction in talk-in-interaction (Bamberg & Georgakopoulou, 2008; Bamberg, 2011b, 2011c; Bamberg, De Fina, & Schiffrin, 2011), he has contributed varied strands to applied linguistics (De Fina, Schiffrin, & Bamberg, 2006; Bamberg, De Fina, & Schiffrin, 2007, 2011; Bamberg, 2011a).

Dr. Bamberg is currently interested in the narrative construction of identities in real-time social interaction, particularly with regard to three challenges that are intrinsic to the achievement of these situated identities. These are (a) the navigation between constancy and change across time, (b) the differentiation between self and other within the interaction, and (c) the management of whether an individual's agency takes precedence over influences from the external world (Bamberg 2011d, Bamberg, et al., 2011). In this thread of his research, he argues for the deprivileging of biographical ("big story") approaches (Bamberg, 2006a, 2006b) in favor of a narrative practice approach that scrutinizes conversational stories ("small stories") that are told in everyday interactions (Bamberg & Georgakopoulou, 2008; Bamberg, 2011b, 2011d). The claim is that it is through the repeated telling and refashioning of these everyday stories that identities are performed, practiced, and appear preset.

A significant proportion of his work on identity construction and development has been on heterosexual boys between the ages of 10 and 15 years. He has been particularly interested in displaying how these boys talk about themselves and their concerns, for example, friends, school, and girls in their own linguistic terms (Korobov & Bamberg, 2004, 2008; Moissinac & Bamberg, 2005). His research has pointed to a shift in the boys' perspective on girls that occurs between the ages of 10 and 12. At 10 years of age, these boys constructed rigid boundaries between themselves and girls, who were depicted as unfathomable and could not be direct objects of desire. At around 12, these boundaries begin to be dismantled and girls are talked about as friends, direct objects of desire, and even potential mates (Bamberg, 2008). It is at this time that it becomes "cool" to have a girlfriend. Dr. Bamberg's work has also revealed that this orientation towards girls becomes more sophisticated at 15 years of age in that one must begin to tread the fine line between desire and desperation (Bamberg, 2004; Korobov & Bamberg, 2004).

Dr. Bamberg is also a proponent of a system of positioning analysis of storytelling that attempts to link the content and evaluation of story events with how people attend to each other in interactional events (Bamberg, 1997a, 2003; Bamberg & Georgakopoulou, 2008). Bamberg's positioning system consists of three levels. The first level is concerned with how a storyteller positions the characters within the story being told. The second level of analysis examines how tellers position themselves with respect to their audience or interlocutors. The third level investigates how tellers position themselves vis-à-vis the master

narratives or dominant discourses in the culture of the telling. This third level transcends the local context of the telling such that the teller is able to provide an answer to the question "Who am I?" (Bamberg, 2003, 2011c, 2011d). More recently Michael Bamberg has suggested that his system of positioning analysis should be a potent methodological tool to uncover the workings of identity construction in linguistic interaction.

Prior to the theorization of his system of positioning, Dr. Bamberg's research focused on children's abilities to take perspectives in narratives and to display these through the production of evaluative statements. With the support of a Spencer Fellowship, he extended this work to include children's choice of linguistic forms and functions in emotionally charged situations (Bamberg & Damrad-Frye, 1991; Bamberg, 1997b). In doing so, his focus shifted from a primary interest in the linguistic organization of plots to a concern with how these children wanted to be understood in situations in which they were strongly personally invested. It is this work that paved the way to his current interests in identity development and identity transformation.

Michael Bamberg completed the Staatsexamen (master's equivalent) in German linguistics and literature, education and theology at the University of Marburg, Germany, in 1975. He subsequently took a position as a German assistant in the language department of the University of York, UK, and worked part-time toward a second master's degree. While at York, he was influenced towards a pragmatic or social practice orientation of language learning and language use by the sociolinguist Robert Le Page and the language acquisition theorist, Patrick Griffiths. He completed an MPhil with a thesis on language development in 1978 and was accepted as a student of language development into the psychology graduate program at the University of California at Berkeley.

Major influences on his work at Berkeley were Dan Slobin, Susan Ervin-Tripp, and John Gumperz, who were his dissertation advisers. In addition, he took classes with George Lakoff, Charles Fillmore, John Searle, and Jürgen Habermas. Having an early interest in metaphor and membership categorization, his mentor in the first two years was Eleanor Rosch. His interest in metaphor fed into narrative, specifically, how metaphors are used as structuring devices for larger speech units. Early work was based on a number of wordless storybooks about a frog, particularly "*Frog, where are you?*" (Mayer, 1969). His dissertation project (Bamberg, 1987) was further developed by his dissertation mentor Dan Slobin (together with Ruth Berman) into a large crosslinguistic project on children's acquisition of, first, tense and aspect, and then narrative in general (Berman & Slobin, 1994).

In 1981, Michael Bamberg took a lectureship in sociology at the Free University of Berlin where he worked on Martin Kohli's project on retirement using biographic methods. In 1985, while still working on his dissertation, he went to Shanghai, China, to teach German and learn Chinese. With his wife, Dr. Nancy Budwig, he had considered starting a large-scale language acquisition project comparing German, English, and Chinese but returned to the USA in 1986 to work at Clark University in Worcester, Massachusetts. Dr. Bamberg is at present a professor of psychology at Clark University.

Basic English

PAUL MEARA

Basic English was developed by C. K. Ogden and I. A. Richards during the 1920s and 1930s. It grew out of an earlier and very influential collaboration which appeared as *The Meaning of Meaning* in 1923. Basic (British American Scientific International Commercial) English was a response to the fact that during the mid-20th century English was rapidly becoming a de facto lingua franca, and was becoming increasingly important as a common language in the commercial, transport, and diplomatic fields (cf. Ogden, 1931). Ogden and Richards saw Basic English as a tool in the development of “world citizenship,” and ultimately as part of the effort to develop a single world language which was understood by all citizens. Basic English was not intended as a replacement for real English, however. Rather Ogden and Richards argue that the simplicity of Basic English removed many of the obstacles that plague learners who are trying to acquire ordinary English and that it allowed learners to communicate meaningfully with English speakers relatively quickly. They saw the transition from Basic English to ordinary English as a relatively straightforward task which could be accomplished as needed.

The defining characteristic of Basic English is that it uses a very restricted vocabulary. Ogden and Richards argued that most ordinary uses of English could be accomplished with this minimal vocabulary together with a small set of grammatical rules that English commonly uses. Other work that was being carried out at the same time (e.g., the work of Harold Palmer and Michael West) similarly tried to reduce the vocabulary load for learners. But while Palmer and West did this by rigorous analysis of the frequency of words, arguing that highly frequent words were more likely to be useful for learners than less frequent words, Ogden and Richards took a different approach. They developed a list consisting of only 850 words: 600 “things” (mostly nouns which they divided into 400 general things and a further 200 picturable things), 150 “qualities” (mostly adjectives which they divided into 100 general qualities and 50 opposites), and a set of 100 “operations” (a mixed collection of verbs, prepositions, and adverbs). These words are combined with a very small number of morphological rules: plurals are formed by adding -s to the things, adverbs are formed by adding -ly to the qualities, and a number of other derivatives can be formed by using the affixes -er, -ing, -ed. Basic English also uses a small number of word order rules covering the formation of questions by inversion and the use of *do*.

The most important simplification implemented in Basic English is that the operator list contains only 16 verbs: *come, get, give, go, keep, let, make, put, seem, take, be, do, have, say, see, send* and 2 auxiliary verbs, *may*, and *will*. More complex verbs are considered to be redundant, as they can almost always be replaced by a combination of simpler words from the Basic list. Ogden and Richards argued that the reduction of verbs to 18 was the key to the discovery of Basic. Most of the irregularity of English is linked to verbs, and by eliminating them, we eliminate a great deal of arbitrariness and difficulty for learners. The remaining 16 verbs are characterized by a strong tendency to combine with other words to express complex meanings. Taken together, the operators and the things can be combined to cover more than 20,000 different meanings. Some examples of this taken from *The General Basic English Dictionary* (Ogden, 1940) are illustrated in Table 1.

2 BASIC ENGLISH

Table 1 Some examples of how complex English words can be expressed in Basic English (Ogden, 1940)

<i>Complex English word</i>	<i>Basic English words</i>
agony	great pain
alley	narrow street
alarm	to put in a condition of fear
album	book of pictures
alloy	mixed metal
allude	say something about
ally	supporter; on the same side
alter	to make a change
amaze	to make very surprised
ambulance	hospital automobile

Table 2 An extract from the Gettysburg address and its translation into Basic English (Ogden, 1937, p. 24)

<i>The original text of the Gettysburg address</i>	<i>Ogden's translation into Basic English</i>
Four score and seven years ago our fathers brought forth on this continent, a new nation, conceived in Liberty, and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. (54 words)	Seven and eighty years have gone by from the day when our fathers gave to this land a new nation—a nation which came to birth in the thought that all men are free, a nation given up to the idea that all men are equal. Now we are fighting in a great war among ourselves, testing if that nation, or any nation of such a birth and with such a history, is able long to keep united. (78 words)

Table 2 illustrates how Basic English can be used to generate extensive texts. The table contains a short extract from Abraham Lincoln's address at Gettysburg.

There are some obvious points to note here. The Basic text is about 40% longer than the original, but it is considerably easier to read. Nonetheless, it reads like a very natural English text and readers not familiar with the original would probably not be aware that this translation is written in a constrained vocabulary and a simplified syntax.

In practice, the vocabulary of Basic English was allowed to exceed the 850 words which appear in the published accounts. Ogden and Richards also include a set of "international" words whose meaning is widely understood even by non-speakers of English. These international words are forms like: *alcohol, automobile, bank, bar, club, coffee, tobacco, and whisky*. There are 50 words of this type. These forms are supplemented by 12 "science" words (*algebra, arithmetic, biology, chemistry, geography, geology, geometry, mathematics, physics, physiology, psychology, and zoology*), and a list of 12 (now somewhat dated) "special names used internationally" (*college, dominion, embassy, empire, imperial, king, museum, president, prince, princess, queen, and royal*). Geographical names, days of the week, month names, and a selection of numbers and measures are also included. Ogden and Richards also allow a set of additions for specific sciences which allow Basic English to be extended to cover what we would now refer to as special purposes. These extensions typically consist

of 100 general science words and a further 50 words which are technical words used in the particular specialism. Ogden and Richards argue that most learners will know the international words before they start learning Basic English, and so these words do not need to be included in the Basic English lists. The additional 150 words needed to cover a specialist field brings the total learning load to only 1,000 words—a total which should easily be acquired by any serious student.

Ogden and Richards point out that the main advantage of Basic English is that it imposes a much smaller learning burden on the learner than normal English does. They argue that the limited vocabulary of Basic English, and the tiny number of grammatical rules, can easily be acquired in a matter of weeks, or in exceptional circumstances, in a few days (Ogden, 1939). At the same time, however, the combinatorial possibilities of this basic vocabulary means that learners who have mastered it will rarely find themselves unable to express their intended meanings and native speakers of English will have no trouble understanding them. They also argue that Basic English provides a ready jumping-off point for progression into “fuller English.”

The Orthological Institute, where most of the research and development seems to have been carried out, was founded in Cambridge in 1927, and a satellite institute was established in Beijing in 1936. Funding from the Rockefeller Foundation played an important part in these developments. This funding, and an association with the publisher Kegan Paul, allowed a large amount of Basic literature to be produced: even during the war years when paper was strictly rationed, the institute published a dictionary and a set of manuals for teachers, a large number of simplified Basic readers, a series of books “about the world in which we live” aimed at younger readers, a set of serious science books in Basic, adaptations of Shaw and Shakespeare, translations of major works in Russian, German, and Japanese, as well as a complete *Bible in Basic English* (1965), originally published in 1941 (New Testament) and 1949 (Old Testament). Formal government support followed after the war, and eventually resulted in the establishment of a Basic English Foundation, which survived until 1955. Ogden died in 1957, and Richards moved to a post at Harvard University where he continued to work on an extended version of Basic English known as EME (Every Man’s English). EME is similar to Basic English in that it has a restricted vocabulary and a simple syntax, but the vocabulary base is fuller: it has 30 verb operators, instead of the 16 listed in Basic English, for example.

Basic English received considerable backing from significant establishment figures of the time: it was formally endorsed by Winston Churchill during World War II, “It would certainly be a grand convenience for us all . . . to find everywhere . . . a medium of intercourse and understanding . . . an advantage to many races and an aid to the building of a new structure for preserving peace” (Churchill, 1943), by the playwright George Bernard Shaw, “a thought out pidgin, . . . [that] gets rid of much of our grammatical superfluities” (Shaw, 1941), and by the novelist H. G. Wells, “one of the unanticipated achievements of the twenty-first century was the rapid diffusion of Basic English as the lingua franca of the world” (Wells, 1933). In spite of this, Basic English seems to have only limited influence on English language teaching practice, and it is difficult to find proper empirical evaluations of its effectiveness. Both Ogden and Richards taught at Cambridge University, but neither had much firsthand experience of language teaching. Ogden was a philosopher by training, while Richards was a specialist in the new field of English Literature. To some extent, Basic English was in competition with an alternative approach to vocabulary load that was being developed by ELT professionals, notably Palmer and West (cf. Bongers, 1947). This work, which largely grew out of Palmer’s teaching experience in Japan, was supported by the Carnegie Foundation, and as a result of this it developed strong ties with new linguistic approaches to word frequency which the foundation had funded during the Great Depression. Unlike the Basic English project, Palmer and West’s work was very

4 BASIC ENGLISH

much in tune with the structural linguistics of the 1950s. *A General Service List of English Words* (West, 1936) dominated the teaching of vocabulary in English in the second half of the 20th century, and continues to be very influential in English teaching syllabuses. Basic English, in contrast, became something of a historical curiosity, treated on the same level as the spelling reform movement, to which it was closely allied. The Basic English Foundation does not seem to have survived long after Ogden's death in 1957, and though Richards lived until 1979, by the mid-1960s, Basic English was no longer a significant force to be reckoned with. An archive of material from the Orthological Institute is housed in the Institute of Education Library at London University.

There are, however, some signs that Basic English might be experiencing something of a revival. Basic English has a significant presence on the Web, notably the Ogden's Basic English site (<http://ogden.basic-english.org/>) and there are a number of sites offering Basic English lessons for non-native speakers of English. Many of these sites appear to be based in Japan, where Basic English still has a strong following. An important new feature is the development of Basic English dictionaries linked to word processing programs. These allow authors to monitor their output and check whether the words they use conform to the Basic English guidelines. This makes it much easier for writers to adapt their style to the Basic English vocabulary.

Bateman, John

CHIAOI TSENG

John A. Bateman (b. 1957) has a distinguished research background in applied linguistics and has contributed to a wide range of research areas since the 1980s. He started working on natural language generation in 1982 and was awarded the degree of PhD in artificial intelligence in 1986 at Edinburgh University. Since then, he has engaged in research projects on language generation, translation science, discourse structures, and descriptive linguistics at Kyoto University, the Information Sciences Institute of the University of Southern California, the University of the Saarland in Saarbrücken, the former GMD Institute of Integrated Publication and Information Systems in Darmstadt, and the University of Stirling. In 1999, he was appointed Professor of Applied Linguistics at the University of Bremen within the Department of English, where he has initiated several linguistic projects on ontology, language, and space.

His research interest in multimodality began in the mid-1990s when he worked in a project on automatic multilingual and multimodal document generation. The multimodal study in this project looked into synergies across different modalities useful for automatic generation, particularly the relations between functional linguistic description and its computational instantiation in generation systems.

Beginning in 1998, Bateman and his colleagues, Judy Delin and Renate Henschel, conducted the GeM (Genre and Multimodality) project, specifically focusing on printed documents and investigating the ways in which different document genres use layout, graphics, and text in combination to communicate. Although the theoretical background of the project was linguistics, Bateman adopted a wider range of methodologies which have been applied to investigate printed documents. This encompassed computerized document recognition applied in early work on optical character recognition, eye tracking, rhetorical design theory, mark-up language applications used in publishing and webpage design. All these different methods were synthesized into the overall multimodal framework and the main result of the GeM project is the construction of an annotation scheme useful for preparing and analyzing multimodal corpora (Bateman & Delin, 2003; Bateman, Delin, & Henschel, 2004; Bateman, 2008).

Moreover, in Bateman's GeM framework, the concept and the analytical approach of *multimodal genre* can be seen having an impact on his later development of approaches to genre in film and other media—in his view, the notion of genre functions to constrain the way specific expectations in the readers of documents are raised. Therefore, genre is treated as a means of comparing different dimensions across different kinds of multimodal texts and testing the effectiveness of the model as a tool for prediction and description. Building on this perspective of genre, Bateman proposes an approach to multimodal genres which can be used to empirically examine fine-grained generic features in specific examples.

In the mid-2000s, Bateman extended his research interest of multimodality from documents to the field of film analysis. In 2007 he published a ground-breaking research article, "Towards a grande paradigmatique of film: Christian Metz reloaded" (Bateman, 2007), specifically focusing on semiotics of film. In this study Bateman provides a thorough review of all previous accounts of film montage made within the long debated tradition. He particularly elucidates the weakness of applying older schools of linguistics (such as structuralist and Chomskyan linguistics) to film and explicates how previous semiotic approaches

are shown to have been restricted to views of compositional semantics only appropriate for syntax. Drawing on advances in formal and functional linguistic theories, in particular the notion of discourse semantics, Bateman proposes a new analytical framework from the perspective of *film-as-discourse*. This perspective supports both the syntagmatic and paradigmatic axes of semiotic description, and filmic code is not restricted to the earlier compositional meaning construction found in syntax.

More importantly, Bateman's discourse approach allows the concept of code to be supplemented with and complemented by inference. Hence, with Bateman's new discourse approach to film meaning, inferential interpretation does not completely rely on the spectator's skill as claimed by the proponents of the problem-solving approach to film. Bateman's development of film discourse provides an appropriate empirical basis for investigating film. In this context, the framework of film discourse is expanded and applied empirically to address film issues such as narratives constructions, cohesion, and coherence of the films with complex chronological structures (Tseng & Bateman, 2010, in press). In 2011, he coauthored a book on multimodality and film, *How Films Mean: Multimodal Film Analysis* (Bateman & Schmidt, 2011), in which his major developments of film discourse are synthesized and systematically correlated to his previous multimodal studies on printed documents, explicitly demonstrating the continuity of his thought in multimodal research.

Bateman's decades-long engagement in the research of multimodal presentation also motivates him to deal with more fundamental yet controversial issues within this discipline. Seeing the term *mode* used in various ways, often loosely and ill defined and tangled with definitions of other terms such as semiotic codes and resources, Bateman (2011) particularly points out the need to consider just what mode and semiotic code in multimodality refers to. He proposes a comprehensive model for semiotic mode drawing on central notions of systemic functional linguistics such as stratification and realization and constructs the strata of semiotic modes which distinguish and interrelate the ground-level material substrate and abstract semantic plane. More importantly, Bateman explicitly unravels just how the stratified model of modes is useful for solving frequently discussed problems in the multimodal literature, for instance, addressing how single material substrates at the lower stratum can support multiple semiotic modes at the higher stratum or how the development of semiotic modes across changes of material substrates can be accounted for.

Through Bateman's dynamic initiation of, and participation in, several ongoing research projects not only on multimodality but also on ontology, artificial intelligence, language, and space, he continues to deepen his theoretical thoughts multidisciplinary, and his dedication and contribution to multimodality and applied linguistics in general still continues to grow tremendously.

Bazerman, Charles

PAUL PRIOR

Charles Bazerman's foundational contributions to the interdisciplinary field of writing and literacy studies have had a wide influence in applied linguistics. As a writing researcher, rhetorician, and literacy theorist, he is particularly known for his contributions to genre theory, the rhetoric of science and technology, writing across the curriculum/writing in the disciplines (WAC/WID), and theories of literate practice as social action.

Born in 1945 and raised in New York, Bazerman was completing a PhD in literature at Brandeis University in 1971, at a point when the field of writing studies (or composition and rhetoric) was emerging in the USA. His teaching in New York, first in an inner-city elementary school in the late 1960s and then in an open enrollment composition program at Baruch College in the 1970s, focused his attention on the complexity of writing, its relations to social power, and the challenges of writing pedagogy. Combining his interests in genre, the social impact of texts, teaching writing to novices, and the formation and communication of specialized knowledge (particularly around science), Bazerman embraced the new field. Bazerman's early publications, such as his (1981) comparison of writing in three disciplines (biology, sociology, and literary criticism), explored links between writing, knowledge, the individual, and social communities or institutions.

Bazerman's seminal work, *Shaping Written Knowledge* (1988), presented an early but sophisticated statement of what has come to be called North American, or new rhetorical, genre studies, typically traced from Miller's (1984) argument for seeing genres as typified responses to recurrent rhetorical situations. In that book, Bazerman analyzed the early emergence and continuing evolution of scientific report genres, particularly through a historical analysis (text linguistic, rhetorical, and interpretive) of the *Philosophical Transactions of the Royal Society* between 1665 and 1800 along with several studies of physics in the 19th and 20th centuries. Bazerman highlighted the intricate interactions among different genres in different communicative forums and networks. He traced, for example, relations between Newton's private notebooks, university lectures, manuscripts, correspondence with Henry Oldenburg (founding editor of the *Philosophical Transactions*), and publications in the *Philosophical Transactions and Optiks, Book 1*.

Consistent with rhetorical approaches, Bazerman's definition of genre drew on phenomenological theory, particularly the sociological work of Alfred Schutz: "Genre is a sociopsychological category which we use to recognize and construct typified actions in typified situations. It is a way of creating order in the ever-fluid symbolic world" (Bazerman, 1988, p. 319). Bazerman argued persuasively for closer attention to historical and situated variations in genre, noting that:

broad, ahistorical, static identification of features such as the standard five-part structure of the experimental report or the use of passive voice and avoidance of first person, are found inaccurate with the slightest amount of historical digging . . . rather, we need to understand why regularities emerge, evolve, and vanish. (1988, p. 315)

His historical and discourse analyses revealed that early scientific report genres did not simply codify practices for communicating findings. Focused textual dialogue among natural philosophers—initially more chains of correspondence than formal report—did

DOI: 10.1002/9781405198431.wbeal0080

push the development of new textual forms. However, Bazerman also showed that as scientists came to anticipate the need to communicate their findings persuasively to absent and skeptical others, they began to develop new kinds of attention to—and changed practices in—the laboratory. Bazerman's research on genre has informed the work of many applied linguists, including Dwight Atkinson, Vijay Bhatia, Ulla Connor, Brian Paltridge, and John Swales.

Methodologically, Bazerman (1988) took up the historical emergence and evolution of genre as a case of Vygotskian sociogenesis (see Scribner, 1985), tracing the development of experimental reports as a cultural form. His approach here and in later research was grounded in Vygotsky's insight that early stages of development make the full grounds of social practices visible in ways that mature mastery obscures. However, Bazerman's analysis was doubly innovative. Most Vygotskian work to date had focused on the development of the individual or of psychological systems such as memory rather than on the development of tools or cultural forms. In addition, his blending of phenomenological and Vygotskian theory became a cornerstone of North American genre studies, seen since in the work of such scholars as Carol Berkenkotter, George Kamberelis, Peter Medway, David Russell, Paul Prior, Clay Spinuzzi, and Christine Tardy. Documenting the coevolution of genre and activity, and linking rhetorical genre theory to activity theory, represented key achievements from Bazerman's research in the 1980s.

Bazerman next worked to detail the ways literate practices participate in complex social systems of science, technology, the economy, and government. Bazerman and Paradis (1991) brought together a number of contributors (including Greg Myers, Jeanne Fahnestock, Cheryl Geisler, and Amy Devitt) to analyze the textual dynamics of contemporary and historical professions. Bazerman's chapter examined how Joseph Priestly constructed a notion of coordinated, literate cooperation as a means to advance scientific and technical knowledge. Bazerman (1993) presented a companion analysis, considering how Adam Smith's early lectures on rhetoric offered critical insights into his later foundational work in economics, *The Wealth of Nations*.

Throughout the 1990s, Bazerman's research focused on the rhetorical, technical, and social practices that Thomas Edison engaged in as he pursued the electrification of society (with the electric light as a wedge technology to enact that vision). In one facet of this research, Bazerman examined how the genre of the patent organized inventive work at the Menlo Park laboratory. Considering the patent led Bazerman (1994, 1999) to ask how speech act theory might handle the complex character of these written performative utterances. A patent application (written as a letter of petition), for example, would typically include verbal descriptions, claims, and drawings. The dialogic nature of the patent (its intertextual relationship to laboratory notebooks, the documentary examination of the patent office, the linkage of petition and grant) led Bazerman (1994) to further develop Devitt's (1991) discussion of *genre sets* (i.e., the repertoire of genres an individual produces in the course of his/her work) and *genre systems* (i.e., linked sequences of genres produced by different individuals, like the patent petition and grant).

This research culminated in *The Languages of Edison's Light* (Bazerman, 1999), a rich historical analysis of the textual and rhetorical practices of Thomas Edison and those around him, of the role of symbolic and discursive systems in development of a new technology. Bazerman noted that a technology needs to not only succeed materially, but "it must also succeed symbolically (that is, adopt significant and stable meanings within germane discourse systems in which the technology is identified, given value, and made the object of human attention and action)" (1999, p. 335). In Bazerman's expansive framework, Edison's rhetorical practices included attracting funding for his Menlo Park laboratory, recruiting and motivating a talented team of inventors, managing relations with journalists, faking technical demonstrations, securing cooperation of city officials through gifts, and

attending to the aesthetics of electric lighting for the home as well as using laboratory notebooks to both support a chain of technical experimentation and document that work for patents. Bazerman highlighted the diverse, often mundane, genres needed to accomplish the work of technological invention and adoption:

The movement from machine shops to Menlo Park and then to multiple power stations is accompanied by increasingly complex involvement with extensive discursive networks necessary for the production, maintenance, and use of the technology: laboratory notebooks, installation and repair manuals, patents, monthly bills for service, publicity pamphlets, technical journals, city ordinances, and stock reports. (1999, p. 336)

Bazerman's research on Edison helped expand the repertoire of genres considered for study and forged key links between rhetoric, speech act theory, text linguistics, writing studies, and science and technology studies.

In the 2000s, Bazerman's work has continued to address a broad range of literate and rhetorical practices, including questions of the evolution of genres (Bazerman, 2000), the social functions and consequences of literacy (e.g., Bazerman, 2006), the nature of information (e.g., Bazerman, Little, & Chavkin, 2003), the textual forms of scientific argumentation (e.g., Kelly & Bazerman, 2003), and methodologies for writing research (e.g., Bazerman & Prior, 2004; Bazerman, 2008a).

Bazerman has also focused his considerable energy and talents on building an international, interdisciplinary field of writing research through editorial scholarship, organizational leadership, and institution building. He edited the Erlbaum *Rhetoric, Knowledge and Society* series, which published 11 books between 1996 and 2002, featuring cutting-edge research on writing in disciplinary, professional, and scientific/technical contexts by scholars such as Dwight Atkinson, Linda Flower, Aviva Freedman, and John Swales. Aiming to forge deeper connections between writing/genre studies and cultural historical activity theory, Bazerman and Russell coedited a special issue of *Mind, Culture, and Activity* in 1997 and the book *Writing Selves, Writing Societies* (2003).

Two edited collections, *What Writing Does and How It Does It: An Introduction to Analyzing Texts and Textual Practices* (Bazerman & Prior, 2004) and the *Handbook of Research on Writing: History, Society, School, Individual, Text* (Bazerman, 2008b), are of particular interest. *What Writing Does* aimed to promote intensified research on writing across the many disciplines that study discourse by introducing key methods for analyzing written texts and writing practices. It included, for example, chapters on linguistic discourse analysis by Ellen Barton, on code switching and second language writing by Marcia Buell, on multimedia texts by Anne Wysocki, and on tracing writing processes by Paul Prior, as well as two chapters by Bazerman (on intertextuality and on speech acts, genres, and activity systems). Bazerman's organization of the *Handbook of Research on Writing*, editorial introductions for sections, and two chapters with Paul Rogers clearly express his vision for an interdisciplinary, international field of writing theory and research that can examine the powerful role writing has played across human history and in the many social and personal domains of human life. The handbook's sections consider how writing emerged as a material and symbolic technology; how writing has shaped cultural and political histories, influencing social institutions and practices; how writing has been realized in different levels and types of schooling; how writing affects the psychosocial development of the individual; and how writing is encoded in the symbolic and material character of texts. Among the chapters that may be of particular interest to applied linguists are ones on documentary society by Dorothy Smith and Catherine Schryer, on multilingual writing development by Dwight Atkinson and Ulla Connor, on writing and speaking by Douglas Biber and Camilla Vasquez, and on text, genre, and coherence by Christine Tardy and John Swales.

Bazerman has been active in many professional organizations. In the Conference on College Composition and Communication (CCCC), affiliated with the National Council of Teachers of English, he cofounded (with Cheryl Geisler) the CCCC Research Network in 1988 and (with Janice Lauer) the Consortium of Graduate Programs in Composition in 1991. He was elected to chair the 2008 CCCC conference in New Orleans. He also cochaired the Fourth International Symposium on Genre Studies (Simposia Internacional de Estudos de Generos Textuais IV) held in 2007 in Turabo, Brazil. (See select papers from that conference in Bazerman, Bonini, & Figueiredo, 2009.) He founded and led a series of three winter conferences on writing research at Santa Barbara in 2002, 2005, and 2008, the last of which, Writing Across Borders, brought together a large, diverse group of international writing researchers and led to an edited collection (Bazerman, Krut, Lunsford, McLeod, Null, Rogers, & Stansell, 2010) that samples different global traditions of writing research. Bazerman has recently worked to identify new venues and leadership to continue this series of conferences, and a 2011 Writing Across Borders conference is planned.

Charles Bazerman's scholarship has deeply informed and shaped studies of writing and genre over the past three decades. He has melded multiple disciplinary traditions to address critical questions of writing, learning, knowledge, and society. His scholarship and institutional efforts together have done much to forge the international, interdisciplinary field of writing studies research where many applied linguists now routinely work.

Belcher, Diane

ALAN HIRVELA

Introduction

Since the mid-1990s it has been impossible to think of work in the domain of language for specific purposes (LSP) without also thinking of Diane Belcher. This has been particularly true in the case of English for specific purposes (ESP), where Diane's voice has resonated strongly, clearly, and persuasively as a scholar and journal editor. In each of these roles she has had a major impact on the development of ESP theory and pedagogy. In particular, she has been a master at synthesizing and interpreting key work in the field and then extracting from it new perspectives and insights that extend the boundaries of the field and challenge how we think about ESP. This has also meant being a leader and a risk-taker, someone willing to question the status quo, to formulate intriguing and valuable new ideas, and to advocate for people not properly represented in ESP.

What stands out in Diane's work is not just her unwavering belief in the importance of linking ESP theory, research, and pedagogy, but her uncanny ability to do so in uniquely perceptive and powerful ways. In her teaching and scholarship she has skillfully articulated the dynamics involved in creating a meaningful, bidirectional relationship between theory and research on one side and classroom practice on the other, with each enriching the development of the other. Also notable is the wide range of theoretical domains she has drawn from, including feminist theory, genre analysis, academic socialization, voice, and sociocultural perspectives on learning.

Diane's contributions to ESP are best seen by looking briefly at the two primary realms in which she has made them, as an author and a journal editor.

Contributions as an Author

Looking at her scholarly work chronologically, Diane's first published foray into the arena of LSP was a 1990 article entitled "The case for teacher-student conferencing in field-specific writing by graduate students." This initial publication featured three of the many hallmarks of her work since that time: an interest in the ESP writing classroom, in academic discourse communities, and in non-native English-speaking graduate students.

Another of Diane's early scholarly contributions can be seen in her groundbreaking 1994 article, "The apprenticeship approach to advanced academic literacy: Graduate students and their mentors," which was her initial appearance in the prominent journal *English for Specific Purposes*, which she later served as editor. In that article, which grew out of a doctoral dissertation writing seminar she had created and taught for a number of years (one of the first of its kind in the world), she described her study of three international PhD students and their interaction with their doctoral advisors using the theoretical framework of legitimate peripheral participation to analyze those relationships. Here she put forth the notion of the advisor-advisee relationship as an *apprenticeship* in which the students and faculty collaborate in initiating students into their academic disciplinary community. While fleshing out that relationship, Diane began to articulate her keen interest in students' experiences with academic discourse and academic discourse communities and her belief

DOI: 10.1002/9781405198431.wbeal0081

in understanding the process of socialization into academic discourse from students' perspectives.

Following closely on the heels of this influential article was the 1995 publication of Belcher and Braine's seminal edited collection, *Academic Writing in a Second Language: Essays on Research & Pedagogy*. The book's title once again reflects Diane's core belief in the importance of including pedagogy in discussions of theory and research. In the introduction to the book, Diane and her co-editor, George Braine, offer a learned exploration of academic discourse and its importance in second language writing instruction within the ESP framework. This book featured the key qualities found in her many later books as well: informative and thought-provoking chapters offering valuable insights in their data and perspectives into ways of strengthening ESP theory and pedagogy.

With respect to more recent scholarship, in her 2004 article, which appeared in the *Annual Review of Applied Linguistics (IRAL)*, "Trends in teaching English for specific purposes," Diane made two notable contributions. First, she carefully synthesized various criticisms of ESP pedagogy and thus brought them into sharper focus while also noting ESP's "ideological permeability," that is, its willingness to "be receptive to criticism and input from a number of philosophical and theoretical fronts" (p. 166). Striking this careful balance between the negative and positive in ESP is another of the key characteristics of Diane's ESP scholarship. Second, she drew attention to ESP's emerging "social situatedness," by which she meant its increasingly deep roots in socially oriented views of learning. To illustrate the growth of the social context in ESP, she explored three domains of this social orientation with respect to the theory and praxis at work within each, as well as the particular strands in which they tend to be applied. As she portrayed the situation, these were: the sociodiscoursal approach: situated genre analysis; the sociocultural approach: situated immersion; and the sociopolitical approach: overcoming the "limit situation." This synthesis of socially oriented approaches to ESP constituted an important formulation of socially driven ESP theory and practice and also illustrated her remarkable ability to apply a wide theoretical lens in interpreting and shaping ESP thought and practice.

In a 2006 article appearing in the *TESOL Quarterly's* 40th anniversary issue, "English for specific purposes: Teaching to perceived needs and imagined futures in the worlds of work, study, and everyday life," Diane provided another significant synthesis and interpretation of ESP theory and praxis. First, she addressed one of the cornerstones of ESP: its emphasis on conducting analyses of learners' needs. Here she pointed out the limitations of traditional views of needs analysis and proposed a more contemporary, inclusive perspective which moves beyond the original emphasis on specialists conducting needs analyses to a partnership between the various stakeholders involved, including learners themselves. She then addressed the traditional "narrow versus wide angle" views of ESP and showed why such a distinction "is a nonissue because instructional decisions should have more to do with the learners themselves than with instructor preference or beliefs" (p. 139). In the remainder of the article she identified and explored two key strands of theory, research, and practice in ESP: (a) genre theory and the use of corpus data; and (b) critical pedagogy and ethnography. Here, as with her 2004 *IRAL* article cited earlier, she offered new and experienced ESP specialists a learned yet accessible framework from which to view, apply, and adjust trends in ESP theory and praxis. She also illustrated, once again, her role as one of the principal synthesizers of the steadily growing body of ESP theory, research, and practice.

Diane's most recent exploration of ESP's theory-praxis connection, her 2009 edited collection, *English for Specific Purposes in Theory and Practice*, is a state-of-the-art examination of the ESP theory-praxis link, as reflected in her introduction to the book as well as in its chapters. In this introduction she once again synthesizes and analyzes ESP literature to offer a comprehensive and contemporary view of the growth of ESP. In this case she

provides an extended examination of themes concerning needs analysis introduced in her *TESOL Quarterly* review article. She begins by discussing various contemporary approaches to conducting needs analyses and employing the kinds of data they produce. She then examines applications of these new forms of needs analysis in the development of what she calls “needs-responsive materials and methods” and “needs-knowledgeable instructors.” In this carefully crafted introduction to the book she does what she has throughout her published work: synthesizes and problematizes previous and current practices in ESP theory, research, and practice, while also articulating future directions in these areas.

Contributions as a Journal Editor

In 1998 Diane began serving as one of the editors of the prominent international journal *English for Specific Purposes (ESPJ)*, widely regarded as the flagship serial publication in the field of ESP. She continued in that role until 2008, when she moved into the editorship of *TESOL Quarterly*. Her selection as an editor of *ESPJ* was an acknowledgement of the landmark contributions she had already made to ESP as a scholar and moved her into an even more important role as a shaping presence in the field. As an editor of *ESPJ*, Diane influenced the evolution of ESP in several ways, beginning with extending the journal’s commitment to creating increased opportunities for ESP specialists around the world to publish their scholarship, especially non-native English-speaking professionals in countries where scholarly resources are scarce. Doing so inspired and empowered a new and more inclusive generation of ESP researchers and teachers to share their work and contribute to the field’s development. In addition, in her interaction with scores of authors as manuscript review processes unfolded, Diane was able to provide invaluable mentoring to emerging scholars still finding their academic “voice.” Diane also wrote numerous thought-provoking introductions to issues of the journal, which broadened the field’s horizons and further established *ESPJ* as a leading source of guidance and inspiration in the field’s growth.

Conclusion

Through her scholarship and her leadership as a journal editor, Diane has been in the vanguard of a second wave of ESP specialists who followed groundbreaking figures such as Hutchinson and Waters, Johns, Strevens, Swales, and Widdowson. ESP began in the world of pedagogy, and as new trends in theory and research have come along, Diane has sought to ensure that the link between theory and practice remains the centerpiece of ESP. While offering critiques of ESP where necessary, Diane has, at the same time, consistently provided important perspectives on new directions to be followed. In so doing, she has played an invaluable role in shaping the development of ESP at a time when its popularity and influence have spread globally. As a teacher—another domain in which she has pushed and enriched ESP’s boundaries—she has contributed creative explorations of theory-driven pedagogical practices. As an author she has produced significant empirical studies and displayed a rare ability to synthesize the field’s currents and trends and to generate rich new perspectives that have pushed the field forward. As an editor of the ESP field’s most prestigious journal, she helped introduce and instantiate important directions in the field and worked closely with many of its most established scholars, as well as creating opportunities for many new ones. As a scholar and a journal editor, Diane has brilliantly bridged the domains of theory and practice, and in the process has earned a place as one of ESP’s most influential and respected figures, someone whose work has made an indelible impression on the world of ESP.

Beliefs in Second Language Acquisition: Learner

PAULA KALAJA AND ANA MARIA FERREIRA BARCELOS

The Beginnings

Second- and foreign-language learners of all ages, from young children to teenagers and adults, have beliefs about language learning. This is true whether learning takes place in formal contexts such as regular English as a foreign language (EFL) classrooms and immersion programs or informal contexts such as home and workplace. Teachers also have beliefs about teaching and learning processes. It is important to understand how learners' beliefs relate to (a) their approaches to learning languages, including use of learning strategies; (b) their background characteristics, such as language learning anxiety; (c) the approaches, methods, or techniques their teachers use in the classroom; and (d) the possible conflicts arising from the differences in learners' beliefs and those of their teachers.

The interest in learner beliefs about language learning can be traced back to the mid-1970s, and more specifically to the discussion of the good language learner and his or her characteristics: Why do some learners get on in learning languages, while others do not?; What distinguishes good learners from poor learners? In this discussion, beliefs (under various names including *mini-theories* and *learning philosophies*) were put forward as one possible explanation, along with others, such as aptitude, motivation, and learning strategies, for differences in language learning outcomes. These are first attempts at recognizing learners' tacit knowledge and its importance in learning languages without, however, yet calling these "beliefs."

With the consequent launching of communicative language teaching (CLT) in the late 1970s and early 1980s, the focus shifted to viewing language as a means of communication, involving negotiation of meaning and an ability to use communication strategies, and to teaching based on learner needs. Overall learners were assigned a more active role (compared to earlier teaching methods) and thus their expectations, experiences, and understanding of issues in language learning were highlighted. The seeds were sown for research on learner beliefs about language learning to begin.

The Classics

Serious research into learner beliefs began only in the mid-1980s with Elaine Horwitz and Anita Wenden reporting on their pioneering studies. Importantly, the term *beliefs* (also referred to as *metacognitive knowledge*, adopted from cognitive psychology) appears for the first time in applied linguistics in 1985, along with the introduction of the Beliefs About Language Learning Inventory (or the BALLI), an instrument to measure learner beliefs about language learning. In her study Horwitz (1987) wanted to find out how common certain popular beliefs were among a specific group of learners. To this end, the BALLI questionnaire was developed. It consists of 34 statements related to language learning, covering

2 BELIEFS IN SECOND LANGUAGE ACQUISITION: LEARNER

1. foreign-language aptitude,
2. the difficulty of language learning,
3. the nature of language learning,
4. learning and communication strategies, and
5. motivation.

The questionnaire was administered to 32 intermediate-level students on an English as a second language (ESL) program at a university in the United States who were asked to indicate whether or not they agreed with the statements on a scale ranging from *I totally agree* to *I totally disagree*. The results showed, among other things, that the majority of the students (75–91%) agreed with the following statements, representing the five areas measured by the questionnaire:

1. It is easier for children than adults to learn a foreign language.
2. Some languages are easier to learn than others.
3. It is best to learn English in an English-speaking country.
4. It is important to repeat and practice a lot.
5. I would like to have American friends.

Overall, this pioneering study can be characterized as descriptive and fairly simple in its design.

With the advocacy of learner autonomy and a consequent boom in providing learners with learning strategy training, the concept of beliefs was further strengthened by the studies carried out by Wenden (1986, 1987). The purpose of her earlier study was to investigate the beliefs about language learning held by learners. A semi-structured interview was used with 25 adult ESL students enrolled in advanced level classes at a university in the United States. The data were subjected to content analysis. The learners were indeed found capable of talking about (a) the language they were learning, (b) their proficiency in the language, (c) the outcome of their learning endeavors, (d) their role in the language learning process, and (e) the best approach to language learning.

At this point (e.g., Wenden, 1991), beliefs about language learning were viewed as *cognitive* entities (and different from facts), based on personal experience or the opinions of significant others (e.g., parents or teachers), characterized as something that learners were aware of and could talk about (statable), stable over time, and potentially right or wrong (fallible). Learner beliefs were further said to concern learners as personalities, the tasks carried out or strategies used and their perceived efficiency or inefficiency. Residing in a learner's mind, beliefs about language learning were considered impossible to observe: they could only be studied by resorting to indirect methods. Typically the two main methods of data collection were either that groups of learners (or teachers) with various backgrounds were asked to fill in a questionnaire, such as the BALLI, in its original or modified format, or they were interviewed.

Continuation of Research Along Two Lines

Research into beliefs about language learning then began to bloom. For the first time, a symposium addressing learner beliefs (Gaies & Sakui, 1999) was organized at AILA 1999, an international conference on applied linguistics; and later on that year an entire issue of *System* was dedicated to research into beliefs about language learning. Research into beliefs took many forms. First, the nature of beliefs was reconsidered (as were the starting points of doing research): even though some researchers still claimed beliefs to be *cognitive*,

possessed by the learner, others argued that they were *social*, and so shared and jointly constructed by the learner and the others involved in the process of language learning. Second, research at this point was characterized by a whole new range of terminology: a host of related terms (with more or less the same meaning) was used in studies of learners, including their *perceptions*, *conceptions*, *personal theories*, *everyday knowledge*, and *folklinguistics*. Third, research into learner beliefs diversified: studies were conducted basically along two lines of research (called by various names by reviewers of the developments in the field over the past 20 or so years, see e.g., Barcelos, 2003; Gabillon, 2005; Bernat, 2008; Ellis, 2008).

The first line of research, referred to as the *normative approach* by Barcelos (2003), followed the path laid down by the pioneers, sticking to a traditional *etic* perspective, borrowed from cognitive psychology (with ideals/principles adopted from the natural sciences) and stressing the *objective* nature of language learning. However, on occasions more complex research designs were resorted to, also. So instead of simple descriptions of a group of learners (or more than one compared), more sophisticated quantitative analyses were conducted to establish correlations, or cause-and-effect relationships, between learner beliefs and other learner characteristics, such as learning strategies, anxiety, motivation or personality, or learner background variables (including gender, age, language proficiency), or combinations of these, by statistical means. The majority of studies of learner beliefs were conducted along these lines, the BALLI continuing to be the most widely used instrument. Yang (1992), for instance, wanted to explore the beliefs about language learning held by second-language learners and their use of learning strategies. She used translations of the BALLI and the Strategy Inventory About Language Learning (SILL) developed by Oxford (1990) with 504 EFL undergraduates in Taiwan. The data were analyzed quantitatively using basic statistical procedures. The relationship between beliefs and strategy use turned out not to be very simple, and needed to be interpreted with caution. Yang added one open-ended question to the BALLI. The responses to this question revealed different beliefs from the BALLI. Some of the beliefs were probably culturally related, such as concerns about losing one's face, making a fool of oneself, or being laughed at.

By contrast, the second line of research opted for a less charted path, referred to as the *contextual approach* by Barcelos (2003), advocating an *emic* perspective, thus highlighting the *subjective* nature of language learning: the language to be learned, being a learner, the learning process, and learning contexts are all charged with positive or negative experiences and loaded with personal meanings (e.g., Kalaja & Barcelos, 2003). Beliefs were gradually acknowledged to be highly *dependent on context* and dynamic or *variable* not only from one occasion to another but even from one moment to another. This, in turn, meant a shift in research methodology. Typically studies were qualitative or interpretative in nature, and a variety of data collection methods were used, possibly in combinations, ranging from questionnaires (now with open-ended questions) and interviews to completion tasks (of the type "Studying English is like . . ."), diaries or journals, observation, and narratives, and the pools of data analyzed, for example, for their content, metaphors, or means of discursive construction. Lima (2005) conducted an ethnographic study in Brazil to investigate the beliefs about language learning held by students (and teachers) and their relationship to motivation to learn English in schools. A semi-structured interview was used with students, teachers and parents, two questionnaires (an adaptation of the BALLI and an open-ended one), autobiographies and diaries by teachers and students, audio and video recordings of classes and drawings by students. The data were subjected to content analysis. A direct relationship was found between beliefs and motivation: "Beliefs determine expectations and value judgments, leading either to motivation or demotivation. Motivation, in its turn, forces individuals to action which again has an impact on success, with beliefs and motivation sustained" (Lima, 2005, p. 64, translated from Portuguese).

4 BELIEFS IN SECOND LANGUAGE ACQUISITION: LEARNER

From the mid-1990s onward, the discussion about the good language learner was placed within an even broader framework: it was argued that four key areas needed to be addressed in order to account for the complexity of language learning (Ellis, 1994):

1. learner language and its characteristics;
2. learner-external factors (i.e., contexts of learning);
3. learner-internal mechanisms (including transfer from the learner's first language); and
4. the language learner him- or herself.

Beliefs were one issue among many others (such as age, affective states, aptitude, motivation and personality) to be considered under the last of these key areas, and were claimed to have an indirect effect on learning outcomes through the learner's choice of learning strategies, or possibly a direct one (for an attempt at a comprehensive account of learner contributions or characteristics, including beliefs, viewed in relation to learner actions and contexts of learning, see Breen, 2001a).

As productive as the two lines of research have been, they have not, however, done full justice to the importance of learner beliefs, as these are viewed as just one of a host of other factors involved in language learning (or teaching). Thus beliefs have not yet been given the recognition that they deserve, especially in relation to learner action.

Most Recent Research

A recent "off-shoot" of the second line of research comprises studies that have been informed by Vygotskian sociocultural theory and Bakhtinian dialogism (Alanen, 2003; Dufva, 2003). Social in origin, and so emerging out of interaction with others, beliefs are eventually internalized and can later change or, as it is now expressed, *transform* when the learner is faced with new experiences of learning in other contexts. Importantly, a further distinction is made between beliefs as *metacognitive knowledge* (or content) and as *mediational means* or tools (or content and control). Metacognitive knowledge has to be transformed into mediational means before it can influence second- or foreign-language learning. This is a way of acknowledging that some beliefs are more important than others, mediational means influencing learner action and thus either enhancing or preventing language learning. However, the relationship between learner beliefs and actions is considered to be far from a simple causal relationship (cf. the first line of research): beliefs can, in fact, influence actions in *complex* ways.

Typically, studies have been case studies, with learners viewed as individuals with their own personalities, learning histories, and agencies (instead of bundles of background variables), *longitudinal* in design, and making use of a variety of data, such as interviews or narratives, now in a broad sense including both verbal and visual ones. An additional methodological lesson concerns *positioning* (Coughlan & Duff, 1994). Whatever method or task is used to collect data, learners have a number of verbal and nonverbal recourses to choose from to report on their beliefs, and these may reveal how they position themselves in relation to the task or the topic at hand. Therefore great sensitivity is required in processing and analyzing data and triangulation of data pools is recommended.

For example, in her longitudinal study, Aro (2009) sought to describe the beliefs about EFL and its learning held by 15 schoolchildren in Finland. The children were interviewed three times over the first five years of school, when 7, 10, and 12 years of age, or years 1, 3, and 5 of school. The data were subjected to content analysis. In addition, use was made of the notions of *voice* and *agency*. The children's beliefs varied from one occasion to another and developed with experience, and at the same time were repetitive as if they had been

generally acknowledged facts of life (e.g., “English is needed abroad”). With time, the voice of a carefree child, even indifferent to English as a language, evolved into that of a language learner and user, with beliefs based on personal experience and an increased use of their own voice (of the type “In my opinion . . .”) as opposed to the voices of significant others around them. The children’s agency also developed from cooperation with their parents and teachers toward independence as learners, or from other-regulation to a higher degree of self-regulation. However, some children had fallen back into the role of a passive recipient of teaching by Year 5 of their studies.

Conclusion: Challenges and Directions for Future Research

The field is blossoming with flowers that come in all colors. To put it more professionally, traditional cognitively oriented research now exists side by side with socioculturally oriented research, launched more recently, these two forming extremes on a continuum of orientations. The current state of affairs is further characterized by the recognition by most researchers that learner beliefs about aspects of language learning are much more *crucial* than was thought before in determining how learners approach their learning of second or foreign languages and as such are complex mediational tools intertwining with learner action in complex ways.

Research on learner beliefs about language learning has come a long way since the first mention of the term *beliefs* in 1985 in applied linguistics. As this entry has shown, different approaches and theoretical understandings point to the importance of beliefs to several aspects of language learning and the language learner, such as anxiety, strategies, and motivation to mention just the most common. However, so far there has been very little research into the following aspects:

- Learner beliefs and *identity* (or second- or foreign-language or L2 selves) and agency: What is the relationship between learner beliefs and identity or L2 selves? What role do beliefs play in constructing and shaping learners’ L2 selves? How can teachers help students to identify with certain beliefs to help them construct possible and ideal selves (Dörnyei & Ushioda, 2009)?
- Learner beliefs and *emotions*. Affective factors have also been a concern of researchers in applied linguistics. How do these relate to beliefs? A recent study by Aragão (2007) carried out in Brazil suggests that emotions and beliefs are intrinsically related. Future research should investigate this aspect further.
- *Change* in learner beliefs: How do learner beliefs change and develop (or transform)? What factors influence this change? How can teachers help in the development of learners’ beliefs?
- Beliefs and *learning*: What is the relationship between beliefs and learning? So far, this relationship has not received much attention and we do not have many insights into exactly how beliefs and learning are related.
- Last but not least we suggest that instead of looking at these issues in isolation, research should try to approach these *holistically*, viewing motivation, identity, and emotions as an ecological system in which each one interacts with and affects all the others.

We hope that research into learner beliefs about language learning will continue to flourish and widen in its scope to include these aspects and bring a more complete picture of the language learner and his or her learning. In this sense, further socioculturally oriented studies (related to agency) would also be welcome.

Beliefs in Second Language Acquisition: Teacher

ANA MARIA FERREIRA BARCELOS AND PAULA KALAJA

Introduction and Overview

Research into teacher beliefs is a relatively new topic in language education; however, in the field of education it was addressed as early as the mid-1970s. In his study, now a classic, Lortie (1975) looked at the socialization into teaching of first-language teachers. The study marked a change in paradigm. Previously, teaching had been viewed as a process-product with an emphasis on teacher behavior and learning outcomes. Now, teacher thinking and knowledge are recognized as playing an important role in teaching. Teaching began to be studied from an emic, or insider, perspective, and so research into what is now known as teacher thinking, teacher cognition, teacher learning, or teacher knowledge was born.

The holders of these beliefs about language learning—and teaching—are learners or teachers, who might find themselves in either pre-service or in-service teacher-education contexts. The teachers can range from novices to experienced professionals; their work can take place in immersion, second- or foreign-language contexts, and they can be teaching children, adolescents, or adults. The beliefs about language learning and teaching held by teachers have their origins in their previous learning or teaching experiences, and depend on one another.

The importance of the beliefs held by language teachers has been related to (a) their reflections about their own practices (whether these help them to reflect or prevent them from doing so), (b) the actions taken and decisions made by them in their everyday practice, (c) their responses to changes or innovations, (d) their process of learning to teach, and (e) the possible resistance to new methods or activities in the language classroom on the part of the students. In addition, after graduation, language majors enter working life as teachers, textbook writers, evaluators, and administrators, and in that sense they are like gatekeepers, mediating their beliefs to generations of learners and others around themselves over careers extending some 40 years in these various roles. It is therefore crucial to find out about their beliefs about language learning and teaching as these might be reflected in their practices not only in classroom contexts but also in out-of-classroom contexts with possibly far-reaching consequences.

One of the major controversies concerning teacher (and student) beliefs has to do with the distinction between beliefs and knowledge. Most researchers make a distinction between beliefs as “based on evaluation and judgment” and knowledge as “based on objective facts” (Pajares, 1992, p. 313). Beliefs have been characterized as (a) non consensual, or disputable in principle; (b) evaluative and affective, although belief systems do have a cognitive component too; (c) episodic (relying on episodes in personal experience, folklore, or propaganda); and (d) open, that is, with wide boundaries that usually involve self-concepts (Abelson, 1979; Nespor, 1987). Knowledge, by contrast, is regarded as open to critical examination and reason. Other scholars, however, do not insist on such a distinction. It is argued that cognitive elements have their own affective and evaluative components.

One way of resolving this issue has been to introduce all-inclusive terms such as beliefs, assumptions, and knowledge, or BAK (Woods, 1996), or simply teacher cognition (Borg, 2003), or what teachers think, know, and believe. To sum up, researching teacher beliefs about language learning and teaching has been a challenging task, not only because of the complex nature of the phenomenon but also because of the variety of terms and definitions introduced in the literature over the years.

Teacher beliefs are now characterized as follows (e.g., Pajares, 1992; Kalaja & Barcelos, 2003). First, beliefs are claimed to be contextual, personal, experiential, social, cognitive, and constructed in discursive practices. Second, they are described as dynamic and variable from one situation to another. Third, they are intrinsically related to actions, which guide and influence them. Fourth, beliefs are part of a teacher's interpretive ability to make sense of the social world around him or her and respond to the problems he or she is faced with. Fifth, beliefs are organized into clusters; earlier beliefs, it is claimed, are more difficult to change because these are more closely related to a teacher's emotions and sense of self. This explains why some beliefs may be more resistant to change. Finally, beliefs play an important role in helping teachers to understand themselves and others and adapt to the world. As such, these provide meaning, structure, order, direction, and shared values. They also help individuals to identify with groups and social systems, thus reducing dissonance and confusion.

Current State of the Field

In their starting points, studies of teacher beliefs about language learning and teaching have almost always been qualitative or interpretative (as opposed to being quantitative). This is in sharp contrast to research into learner beliefs. One explanation for this may be that understanding beliefs held by teachers is closely related to their actions in classrooms.

In order to find out about teacher beliefs, data have been collected from teachers themselves (and possibly from their learners) by a variety of means, including classroom observation, questionnaires, interviews, and reflective writing such as journal writing and narratives (for a critical review, see Borg, 2006). The subjects (or participants) under study have varied from pre- and in-service teachers to those in continuing education. Novices have been compared to teachers with a number of years of teaching experience either in cross-sectional or in longitudinal studies, the latter research design being, however, still quite rare.

The issues that the studies of teacher beliefs about language learning and teaching have addressed range from specific (e.g., beliefs about teaching grammar or reading, the use of the first language in the classroom, error correction, assessment, and technology) to general in scope. Crucial issues include teacher beliefs and their relationship to (a) actions, (b) change and teacher learning, and (c) beliefs held by their students. Below, each of these will be discussed and illustrated with one or two studies.

Teacher Beliefs and Actions

These days it is widely recognized that beliefs about language learning and teaching held by teachers influence their actions, and at the same time their actions influence their beliefs. In other words, the relationship is interactive. It is therefore important to understand how these stand in relation to one another, and what role contextual factors might play in this. For example, the beliefs held by a teacher may not be in line with his or her practice(s) because of clashing interests or ambiguities in the context, including large group sizes, low student motivation or proficiency, dull textbooks, or too many administrative pressures.

In his study, Woods (1996) wanted to find out how the beliefs, or BAK, of eight ESL teachers in Canada related to their decision-making processes. Importantly, these were viewed in relation to the courses taught as a whole. Use was made of ethnographic interviews, observations, and stimulated recall interviews based on videotaped lessons. The results suggest that BAK and behavior do not necessarily correspond. This can be explained by the presence of routine and unconscious actions being reflections of prior teacher beliefs. Contradictions or inconsistencies between teacher beliefs and practices can provide insights into the culture of teaching. Teachers may find themselves, for example, in a subordinate position in relation to their supervisors, principals, or researchers. This might make them subscribe to beliefs based on what they think is part of the current teaching paradigm, instead of what they actually do in class.

Beliefs, Change, and Teacher Learning

The discussion of changes in teacher beliefs about language learning and teaching is related to two processes: changes that pre-service teachers go through while in teacher education, and changes made in their practices by in-service teachers.

Borg (2003) distinguishes between behavioral and cognitive changes: A change in actions does not necessarily lead to a change in beliefs, or vice versa. Woods (1996), however, claims that change is a very complex process: Old beliefs have to be deconstructed and give room for another set to be re-constructed. This, in turn, might lead to periods of confusion and frustration. However, most authors agree that change is gradual. Taking risks and experiencing periods of uncertainty are important aspects of this process. The beliefs held by teachers are intrinsically related to their identities, and this might complicate the process of change. Thus, proposing a change in beliefs may be perceived as a threat to their identities. Despite these cautions, the literature suggests that in order for a change to occur teachers must first make their beliefs explicit (before wishing to change them), be given opportunities to reflect on why certain practices and beliefs might work better than those they are used to, and finally be given the chance to try out alternative practices (Feiman-Nemser & Remillard, 1996).

Richards, Gallo, and Renandya (2001) investigated the factors that prompted ESL teachers in Hong Kong to change their beliefs. Personal factors and the professional contexts turned out to play a strong role in triggering teacher change. In addition, factors such as dissatisfaction with the present situation, change in the teaching context, and conflict between new beliefs and current practices caused change(s) in teacher beliefs.

Teacher and Learner Beliefs

In order to understand the complexities of beliefs in school contexts, it is gradually being recognized that it is not enough to study the beliefs held by one group (consisting of either teachers or students) at a time; these should be studied in a single study involving both parties to see to what extent their beliefs are the same or different in the specific context where they find themselves (e.g., Block, 1990; Allen, 1996; Barcelos, 2000). While learners may not necessarily learn what their teachers attempt to teach, a match in their beliefs is thought to be productive to learning, increasing motivation, and a mismatch in this respect counterproductive.

Understanding this relationship (and especially mismatches) can provide insights into a number of aspects of the language classroom such as (a) misunderstandings and miscommunication, (b) challenges by students to their teachers' credibility, (c) the engagement of learners in strategies disapproved of by their teachers, and (d) withdrawal and feelings of

unhappiness experienced by students. In short, the mismatches can affect learners' motivation, efforts, and the types of activities they choose to take part in.

Most studies addressing a match or mismatch in teacher and learner beliefs have made use of questionnaires with closed questions administered to both teachers and students (such as the Beliefs about Language Learning Inventory or BALLI). As a rule, however, the teachers and students studied have been chosen randomly, coming therefore from different contexts (e.g., Peacock, 1998; for the most recent study of this type, see Brown, 2009), although, as we have argued above, if beliefs are acknowledged to be complex contextual constructs, teacher and learner beliefs should be investigated in specific contexts. The following examples illustrate research conducted along these lines—with consequences in the methodological choices made by the scholars concerned.

In his study, Block (1990) interviewed 22 adult learners and 14 teachers of EFL in a private language school in Spain about their beliefs about language learning and the roles of teachers and students. It turned out that the teachers saw themselves as guides and nurturing parents, whereas the students saw them as controllers of classroom activities. The mismatch can be explained by a difference in point of departure. Accordingly, the students believed that their job was to pay for the course, and invest enough time and effort just to make it to class; it was the teacher's job to do the rest. By contrast, the teachers believed that their task was to coordinate language learning and ensure an environment conducive to learning; it should be the students who actually do the learning. In addition, the teachers and students differed in the sources of their beliefs: The teachers were informed by a combination of their theoretical readings and professional discussions; the students, by contrast, relied on their own experiences and those mediated by their teacher in class.

In a case study, Allen (1996) wanted to find out to what extent the beliefs, perceptions of success, and behavior of a learner taking intermediate Academic English in Canada were influenced by the beliefs about language learning held by his teacher. For this purpose, data were collected by a number of means: classroom observation, interviews with the teacher and the student, and diary entries written by the student. These were complemented with the analysis of relevant documents, including the course textbook, handouts, and additional materials prepared by the teacher. The student seems to have been affected by his teacher. Originally the student believed that the teacher was responsible for his learning, that interaction with native speakers was the best way of learning English, and that he should aim at native-like pronunciation. The teacher, on the other hand, believed that learners did not have to strive for native-like pronunciation. In addition, the teacher emphasized the role of learners in class as responsible for their own learning. By the end of the term the student's beliefs more closely resembled those of his teacher.

Conclusion: Challenges and Directions for Future Research

Language-teacher beliefs about learning and teaching continue to intrigue researchers all over the world, with an ever-increasing number of studies, book chapters, or full books published on this topic. Teacher beliefs continue to be seen as one of the most important keys to understanding teachers' cognitions, knowledge, and practices, as well as their process of learning to teach. However, there are still a number of issues that remain as challenges for future research.

One of the main challenges, pointed out by Pajares (1992) and Borg (2006), relates to the relationship between teacher cognition and learning outcomes. In other words, how do teacher beliefs influence successful learning? Is a mismatch of teacher and student beliefs really counterproductive? What kind of teacher beliefs can enhance student learning?

The second challenge and direction for future research is related to the relationship between teacher beliefs and identities. How do teacher beliefs influence the construction

of their identities? As suggested by recent studies (e.g., Kubanyiova, 2009), investigating this aspect may help explain some of the dissonance between teachers' actual practices and the imagined cognitions and identities they wish to construct. Future research should investigate this aspect further.

The third challenge that future studies could investigate more deeply is the relationship between teacher beliefs and emotions. This is an aspect that has not yet been addressed in language teaching, but it is already a trend in general education (Zembylas, 2006). Important questions to address include: How do emotions and beliefs affect each other and help in the construction of teacher identities and practice(s)? How do emotions relate to teacher beliefs and influence teachers' decision making?

Further studies conducted within sociocultural theory (Johnson, 2009) would also be welcome. More specifically, we need more studies addressing the question of how beliefs held by teachers function as mediational tools in their specific contexts or communities of practice.

A challenge of yet another type would be to look at teachers and their beliefs about language learning and teaching in relation to those held by other people (besides students) found in the school context, including parents, colleagues, principals, and local school authorities. Or why not move beyond the classroom and study the beliefs held by teachers in the various other roles they might play (or contexts in which they find themselves) in the course of their professional lives, for instance as study counselors, as producers of textbooks, as evaluators of learner performance or proficiency giving course grades or marking high-stakes examinations, or as administrators making policy decisions concerning languages at local or national levels?

In conclusion, the research so far has managed to reveal the intricate and multifaceted nature of language teachers' cognitions. We hope that further research on this topic in applied linguistics continues to contribute to our understanding of teachers' lives, cognitions, and practices.

Bell, Allan

PHILIPPA SMITH

A dual career as a journalist and an academic set Allan Graham Bell (1947–) on a pathway to international recognition for his exceptional contribution to the study of language and communication.

Bell's work on referee and audience design, news discourse, media language, and New Zealand (NZ) English is particularly highly regarded and considered required reading in many sociolinguistic courses around the world. His research interests cross a number of methodological and disciplinary boundaries and intersect with many different areas of language use such as identity and voice.

Although born in Wellington, New Zealand in 1947, Bell spent the first 10 years of his life in Palmerston North until the untimely death of his father who was a minister of religion. Bell moved to Auckland with his family where he continued his education, achieving the status of top humanities student in the New Zealand national scholarship exams in 1965. In his adult years his ever increasing interest in language became apparent with his academic accomplishments at the University of Auckland, where he gained a Bachelor of Arts (1968) and a Master of Arts (First Class) in English and German, literature and linguistics (1969), and a doctoral thesis titled *The Language of Radio News in Auckland* (1977). Between his postgraduate degrees Bell spent time in Europe studying linguistics and applied linguistics at the University of Stuttgart and completed a year of predoctoral study at University College London.

While a student at Auckland University Bell sharpened his editorial skills with the production of a regular newsletter for Christian university students and, in a one year break from his PhD studies in 1976, he edited the somewhat controversial university student newspaper *Craccum*.

Bell's foray into postdoctoral employment saw him move back to Wellington—New Zealand's capital city and the hub of government departments. Here he held various editorial, journalist and media consultancy positions over a nine year period (1978–87) with the Department of Science and Industrial Research (DSIR), the Ministry of Agriculture and Fisheries, and the Ministry of Works and Development. Interspersed with these roles were periods overseas where Bell was a visiting research associate at the Center for Applied Linguistics, in Washington, DC in 1981, and in 1982 a Leverhulme postdoctoral scholar at the University of Reading, in England. While continuing his media work for the DSIR from 1987 to 1992, Bell wore several other vocational hats—from a self-employed researcher, author, and editor, to a consultant in applied sociolinguistics, media, and communications.

Overlapping with this period from 1987 to 1996, Bell held various part-time academic positions, first as an honorary research fellow and then as a senior research fellow in the Department of Linguistics at Victoria University in Wellington. In 1989 Bell was also a fellow of the Stout Research Centre at Victoria University which is dedicated to scholarly research in New Zealand society, history, and culture.

Following a short period in 1994 as a visiting senior research fellow at the Centre for Language and Communication Research at the University of Wales Cardiff, Bell, drawing on his many years of editorial expertise, cofounded the *Journal of Sociolinguistics* along with Nikolas Coupland (Cardiff) in 1997. Adam Jaworski (Cardiff) joined them as reviews editor. The journal, published by Wiley-Blackwell, receives about 150 submissions a year

from academics wishing to publish in a high-quality sociolinguistics periodical. Aside from leading the editorial team, Bell continues to oversee the publication processes of the journal.

Bell returned to Auckland in 1997 where, in the Department of English linguistics program at the University of Auckland, he taught sociolinguistics and continued his research in media and language styles. In 2000 Bell became a research fellow at the Woolf Fisher Research Centre within Auckland University's School of Education. However, the following year he accepted his first full-time academic position, at the Auckland University of Technology as professor of language and communication and founder-director of the Centre for Communication Research (later renamed the Institute of Culture, Discourse and Communication). Teaching, research management, mentoring students, researching, and writing have since occupied his full attention.

Bell's journalistic experience prepared him well for research into language and media. He is perhaps best known for his theory and framework on audience design which was first promulgated in his seminal article "Language Style as Audience Design" published in *Language in Society* (1984). Audience design originated from Bell's research comparing two radio stations with audiences from opposite ends of the socio-economic spectrum. Bell suggested that the linguistic style-shifting of the newsreaders was in response to the audience enabling them to establish a greater sense of intimacy or, conversely, to create distance. Bell broadened this concept to include people in everyday life—in the way they choose their language, language variety, or specific linguistic features to respond to an audience. Referee design, as an aspect of audience design, proposes that people initiate language to construct different identities depending on their audience. Central to both these concepts is the role of the audience in how it listens to what is said and the way it responds, thereby giving "voice" to others on an individual level and on a wider social and political platform (Bell, 2007a). Bell's audience design framework provided an alternative to other contemporary theorists such as Labov, Gumperz, and Milroy (DeFelice, 1996), yet it became the leading approach to style in sociolinguistics internationally from the 1990s onward and is frequently cited in academic literature.

Two noteworthy publications that mark Bell's prominence in the field of media discourse are *The Language of News Media* (1991/2001), and *Approaches to Media Discourse* in which he contributes two chapters (Bell & Garrett, 1998). Bell's practical journalistic experience not only gave him firsthand knowledge of news writing—particularly apt in his deconstruction of news articles and the editorial processes involved—but it also facilitated a clear writing style in these books. Although not conceived as a text book it is not surprising that *The Language of News Media* has been widely used as one. Alongside publications written by van Dijk (1988) and Fowler (1991), the book is perceived as one of the first texts to critically analyze news media and has become a primary research monograph in the applied linguistics field, with a total of five reprints.

Bell (2007b) names Russian philosopher Mikhail Bakhtin as one of his academic icons, identifying the concepts of centrifugal and centripetal language as being a key influence on his work on language and identity (2007c). Centripetal forces pull language together in an effort to standardize and establish uniformity and homogeneity. But it is the centrifugal forces which Bell says, as a sociolinguist, he finds most fascinating describing them as "always whirling language apart into diversity, spinning new words, new dialects, new accents, new languages, new voices, regardless of all efforts to the contrary by academics, educators, politicians or pedants" (2007a). Advertisements have been linguistic "rich points" for some of Bell's research because they offer an "invaluable repository of sociocultural matter" (2007b) particularly in the formation of identity (see Bell, 1992, 1999).

Living in a small and somewhat isolated country such as New Zealand allowed Bell to research NZ English—an area that had been largely ignored in academic circles and

one that could be typified as an example of centrifugal forces at work. In conjunction with Janet Holmes and Mary Boyce (Victoria University), Bell conducted the Porirua Project (1989–93)—the first major investigation into everyday NZ English. It highlighted the distinctiveness of conversational NZ English and launched it to become one of the most studied varieties of the language internationally.

Recognizing that NZ English continues to evolve, Bell further explored this area (Bell & Kuiper, 2000; Starks, Harlow, & Bell, 2005), expanding it to include other language varieties such as Māori English (Māori being the indigenous people of New Zealand) (Bell, 2000). In 2009, during sabbatical leave, Bell was visiting professor in World Englishes at the University of Regensburg in Germany.

Bell's concern with addressing social and practical issues through his knowledge about language and communication is seen in his involvement in a wide range of projects which go beyond linguistic analysis. These include a somewhat prophetic investigation into media reporting and public understanding of climate change in New Zealand (Bell, 1994), and an examination of the impact of media technologies on society such as television violence (King et al., 2003) and the Internet (Bell et al., 2008). Bell has also undertaken advocacy roles and was influential in the government's decision to support, promote and sustain Māori language through broadcasting (Bell, 2010). His involvement in the Pasifika Languages of Manukau project (2000–2) highlighted concern about the maintenance of the community languages of Samoan, Cook Island, Niuean, and Tongan people living in Manukau in Auckland (Bell, Starks, Davis, & Taumoeofolua, 2001; Taumoeofolau, Starks, Davis, & Bell, 2002).

Bell's passion as a sociolinguist can be summed up in these words taken from his inaugural professorial address where he portrays himself as

someone whose working life has been in language and how language functions—language as structure, language as manifestation; language as social fact and as identity bearer; language as interaction, as communication, as a bridge between self and other; language as truth teller and as deceiver; language as expresser; language as delight, language as miracle. (Bell, 2007b)

As a journalist, an academic, and a teacher there is no doubt that Bell's relationship with language has been a two-way process in which he has relished both the knowledge he has gained and the knowledge he has given.

Berk-Seligson, Susan

YVONNE A. FOWLER

Susan Berk-Seligson (b. 1947) graduated with a first degree in Spanish and was subsequently a Peace Corps Volunteer in Costa Rica before obtaining her MA in Linguistics in 1971. The subject of her doctoral thesis was *Phonological Variation in a Synchronic/Diachronic Sociolinguistic Context: The Case of Costa Rican Spanish* and she duly obtained her PhD from the University of Arizona in 1978. She taught in the Modern Languages Department of Purdue University from 1983 to 1985 but spent the bulk of her career (from 1985 to 2004) at the University of Pittsburgh. Here she taught in the Hispanic Languages and Literatures Department but also held a secondary appointment in the Department of Linguistics where she was Director of the MA program in Hispanic Linguistics. At the time of writing she was at Vanderbilt University in Nashville, Tennessee, and has held a post as Associate Director of the Center for Latin American Studies as well as Director of Graduate Studies of that Center.

Berk-Seligson's research interests lie in sociolinguistics, forensic linguistics, pragmatics, discourse analysis, and language and gender. Her seminal work *The Bilingual Courtroom*, first published in 1990, revised and updated in 2002, and awarded the prize for Outstanding Book in the Field of Applied Linguistics by the British Association for Applied Linguistics, has had a major and far-reaching influence on research and practice in court interpreting. Drawing upon over 100 hours of audio recordings in federal, state, and municipal courts in the USA, she presents the first ethnolinguistic analysis of interpreter-mediated interaction in the courtroom. She clearly demonstrates how an interpreter alters the dynamics of the courtroom in highly visible ways: the swearing of the interpreter's oath; responding to challenges in interpretation by bilingual attorneys, who also often mistakenly address the interpreter instead of the defendant; and intervening to clarify witnesses' responses, among many others.

Her groundbreaking psycholinguistic study in the same volume of more than 500 mock jurors' reactions to different styles of interpreted testimony show how interpreters can unwittingly change both the testimony styles of witnesses and the questioning style of attorneys by including or excluding such features as politeness markers, hedges, and hyperformality in their interpreted utterances. Mock jurors were found to react positively to the use of politeness markers and hyperformality by witnesses, for example, and rated them as more convincing, competent, intelligent, and trustworthy than when those features were absent. Interpreter-mediated testimony, then, could mean the difference between being found innocent or guilty of a crime. As a result of her research into interpreting, Berk-Seligson is now a member and Research Affiliate of the Advisory Committee which oversees the Federal Court Interpreter's Certification Exam administered by the National Center for State Courts in the USA.

Her interests in the language of legal settings and that of gender were the focus of her research into the discourse of domestic violence. She served as a member of the National Advisory Board of the National Center for State Courts project: "Serving Limited English Proficient (LEP) Battered Women: A National Survey of the Courts' Capacity to Provide Protection Orders." She has also conducted research into domestic violence amongst indigenous Ecuadorians. As a result of this work she coauthored, with Shonna L. Trinch, "Narrating in Protective Order Interviews: A Source of Interactional Trouble" (2002).

DOI: 10.1002/9781405198431.wbeal0085

Her latest book, *Coerced Confessions: The Discourse of Bilingual Police Interrogations* (2009) examines the questioning of LEP suspects by “bilingual” police officers. The book serves to highlight and contrast the lack of any legal requirement for the use of interpreters at the police station with the relatively high degree of regulation to which court interpreting in the USA is subject, and is an indictment of police practices in relation to the interrogation of non-English-speaking suspects, where family, friends, and even codefendants may be used as interpreters as well as police officers. The book sets out to answer the question of why people confess to crimes they have not committed, and posits that non-English-speaking suspects should be regarded as vulnerable along with other kinds of interlocutors. There appears to be no requirement at national level to record police interviews of suspects to provide accountability and facilitate analysis, and very few US states have yet passed laws in this regard.

Berk-Seligson investigates a variety of strategies used by these officers when questioning LEP detainees. In one case a so-called bilingual police officer could not successfully assume the impartiality required of an interpreter and unwittingly shifted into interrogator mode through the use of first person plurals, including both himself and his co-interrogator in his questions. Discussion of the Miranda Rights also feature in the work; since there appear to be neither standardized translations of the Miranda Rights nor standardized procedures for officers to check the detainee’s comprehension, the latter’s rights are often violated. In yet other cases the officers’ knowledge of Spanish was so limited as to render any interrogation virtually incomprehensible. Some still languish in prison as a result of coerced confessions.

Berk-Seligson has appeared many times as a linguistic expert witness in first-degree murder cases, often involving capital punishment, and also in cases where linguistic minorities assert their right to speak a language other than English in the workplace. She has also appeared in class action lawsuits initiated either by the Equal Employment Opportunity Commission or by private law firms. These are mostly cases of English-only policies operated by private companies. In addition she has been called as an expert in US Immigration and Naturalization hearings in regard to the provision of and right to good quality interpreting services.

In 2006 she conducted interviews with 93 Ecuadorians on a US Agency for International Development project in order to investigate the linguistic challenges associated with the proposal to give indigenous communities greater judicial autonomy in Ecuador. She found a lack of consensus in this regard among those she interviewed: namely, members of the judiciary at various levels, interpreters, translators, and local and national political leaders. This was evident both among the *mestizo/blanco* administrators of state justice and those within the Quichua-speaking communities themselves. Judicial rights for indigenous minorities have been guaranteed by law since 1998, but some among the judiciary would deny these rights and others uphold them. Many Quichua communities desire complete judicial autonomy while others within that same community would prefer to remain within the state justice system. Central to this issue is the provision of interpreters, who should pay for them, and to what standard they should perform their task. This work, in progress at the time of writing, will culminate in a book, *Human Rights, Gender, Language, and Ethnicity: Judicial Systems in Contact in the Andean Sierra*.

Bhatia, Vijay

JANE LUNG

Vijay Kumar Bhatia is known internationally as one of the leading researchers and theorists on the subject of genres and is a renowned international author in the field of English for specific purposes. He is best known for his work in critical genre analysis of professional discourse. Over the past 44 years his specialities have grown to include discourse and critical genre analysis, legal analysis, as well as ESP and professional communication (theory and practice). He is a professor in the Department of English at the City University of Hong Kong and the founding president of the Asia-Pacific Association of LSP and Professional Communication; he is also an adjunct professor at the Macquarie University, Sydney, Australia.

Bhatia was born and raised in India, where he received his first degree in science and mathematics and an MA in English and American Literature. The early years of his study of professional communication in general, and genres in particular, began in 1968. At that time, as a young teacher and lecturer, he was asked by the School of Law at the University of Rajasthan in India to develop a specific program in English for law students. This began not only his interest in genres, but particularly in communication in law with its different types of legal documents. This experience in turn led to his first research-based investigation of the use of English in law at a time when the field of English for specific purposes (ESP) was relatively new. After attaining his MLitt (Bhatia, 1977) in India and his MA in Lancaster, UK (Bhatia, 1979), he then moved on to the University of Aston in Birmingham (UK) and studied for his PhD in discourse analysis under John Swales, investigating the formal and functional characteristics of qualifications in legislative writing and its application to English for academic legal purposes (Bhatia, 1982). There he became involved in a groundbreaking project analyzing research article introductions. During his time at Aston he had primary responsibility for establishing a resource center which has now become the largest ESP reference collection anywhere in the world and which he managed for its first four years, from 1979 to 1983.

Bhatia has taught at both undergraduate and postgraduate levels for more than 40 years, first in India, then in the UK, Singapore, and Hong Kong. His first academic appointment was as a lecturer at the University of Rajasthan in 1966, later moving on to join the University of Aston in Birmingham in 1979. After completing his PhD he took an academic position at the National University of Singapore first as a lecturer (1983) and then as senior lecturer (1986), he then went to the City University of Hong Kong as associate professor (1993) and as professor (1996). His work has involved the planning, designing, teaching, and testing of courses and modules in a large variety of academic areas, including discourse variation in professional communities, research methods in ESP, teaching of ESP, discourse and genre analysis, acquisition of specialist competence, and English for law. He has also been involved in the development of MA-level teacher training and applied linguistics programs at universities around the world, including the University of Aston in Birmingham, the National University of Singapore, the University of Malaya in Kuala Lumpur, and the City University of Hong Kong.

Among his most significant research projects has been his study on the *Teaching of English in Meeting the Needs of Business Education in Hong Kong*. This was done in collaboration

with Christopher Candlin and other colleagues from five participating institutions. The resulting report contributed greatly to the development of more effective language programs in English for business communication. Another significant project has been *Genre Bending in Corporate Disclosure Documents*. The study used a multi-perspective critical genre analysis of corporate disclosure documents to analyze the appropriation and exploitation of linguistic resources that corporations used to promote their corporate interests within the process of factual corporate reporting thus projecting a positive and encouraging image of the corporation even when the corporation under-performs during that period.

Regarding Bhatia's research in legal discourse, he helped lead a groundbreaking study, again in collaboration with Candlin, focusing on *Strategies and Competencies in Legal Communications*, again in collaboration with Candlin, whereby the communication needs of legal professionals in Hong Kong were investigated. The outcome of this project contributed to the recommendations of an international committee appointed to propose reforms in the legal education programs in Hong Kong. A second study, *Generic Integrity in Legal Discourse in Multilingual and Multicultural Contexts*, also by Bhatia and Candlin, included colleagues from the School of Law (City University of Hong Kong) and 12 international teams of scholars from Italy, Denmark, France, Germany, the Czech Republic, South Africa, India, Hong Kong, Brazil, Finland, Malaysia, and Croatia. This project investigated the integrity of arbitration laws across linguistic, sociopolitical, and jurisdictional boundaries and was subsequently published in five edited volumes, bringing to the fore Bhatia's ability to coordinate diverse people from diverse cultures providing a platform for these various research teams while enabling them to exchange their contributions in a meaningful way. This in turn has culminated his current project, *International Commercial Arbitration Practices: A Discourse Analytical Study*, which involves more than 25 scholars from 15 different countries. This project is investigating the extent to which the integrity of arbitration principles is maintained in arbitration practice. It focuses on the nature and the extent of the colonization of commercial arbitration practices in international contexts, and explores the motivations for such an interdiscursive process. The outcome of this project will contribute significantly (a) to the understanding of mediation–arbitration–litigation perspectives in the context of “arbitration in action,” (b) the strengthening of international commercial arbitration as a nonlitigation practice for handling commercial disputes, and (c) the development of authenticated professional packages for international arbitration training.

Bhatia thus may be best known for his research in legal discourse. Reflecting on the importance of this focus of study in the field of ESP in a recent interview with Carliner (2010): “I think the important aspect of legal discourse is the way different legal genres interact and co-construct each other.” In his view, “teachers will perform more satisfactorily by combining different and overlapping genres in a particular disciplinary domain, and even across domains, in some cases” (Carliner, 2010, p. 64). While noting that the tendency has been to focus on the use of lexicogrammatical resources, he remarked that it has often been overlooked that “this genre forms the very basis for the construction and interpretation of other equally important and identifiable genres, such as the legal judgments and cases, agreements and contracts, pleadings and case notes, to name only a few” (Carliner, 2010, p. 64). Bhatia concluded the interview by observing, “the most economical, efficient and effective pedagogical strategy would be to teach them together, interdiscursively developed in the context of legal practice, rather than in isolation” (Carliner, 2010, p. 64). As reflected in this interview, his voice has been an important one in the debate on what the relationship of subject content and language instruction should be.

The prolific aspect of his work can be seen from the literally hundreds of publications contributed to journals, book chapters, edited volumes, and individual books. He has published widely internationally on the analyses of legal, business, newspaper, and adver-

tising genres; ESP and professional communication (theory and practice); simplification of legal and other public documents; and cross-cultural and disciplinary variation in professional discourses. Along with serving on the editorial boards of top journals, Bhatia has also influenced the field through his organization of a number of international conferences, symposiums, workshops, and roundtables that focused on LSP scholarship in academic, professional, and workplace contexts.

Along with his many articles focusing on genre, power, and discourse, he coedited a number of volumes with his ESP colleagues. The two most significant ones include, in collaboration with Maurizio Gotti, *Explorations in Specialized Genres* (2006), and with John Flowerdew and Rodney Jones, *Advances in Discourse Studies* (2008). He has also published multiple book chapters on genre and discourse studies in edited volumes with more than nine top publishers.

As to his published works, the best known of his books, *Analysing Genre: Language Use in Professional Settings* (1993), provided a comprehensive introduction to a relatively new and unexplored area of discourse studies: the analyses of nonliterary genres. In this book, he provided answers to the key question in discourse studies, "Why is a particular text genre written in the way it is?" Another important contribution of this book was the extensive discussions of cross-cultural variation in many academic and professional settings, including a variety of examples from a wide range of non-native contexts.

Another of his books, *Worlds of Written Discourse: A Genre-based View* (2004), is now widely used as a resource for further research and practice in ESP as well as discourse and genre studies. This book looks at the tension existing between the written discourse and its representation in applied genre-based literature by addressing the problem from the perspectives of four different worlds: the world of reality, the world of private intentions, the world of analyses, and the world of applications. By proposing a multi-perspective, three-space model of discourse analysis, Bhatia moves genre theories away from educational contexts into the real world and proposes a multidimensional and multi-perspective model for analyzing written professional discourse, extending substantially the notion of pure genre to incorporate new configurations such as genre colonies, genre mixing, genre-embedding, and genre bending.

To summarize, it can be seen that Bhatia has been a major force in extending genre analysis from a purely linguistic analysis of academic and professional discourses to the analysis of professional practices and disciplinary cultures. Along with a more comprehensive, multi-perspective, and multidimensional view of genre analysis, Bhatia's own contribution moved the application of genre analysis from the classroom to the reality of the workplace which, as he noted, is a "much more complex and dynamic real world of discourse" (Carliner, 2010, p. 63). His research also delved into the fact that different professional contexts require different kinds of expertise and that there are different conventions associated with specific professional practices and disciplinary cultures, leading to the conclusion that learning these conventions of use, in some contexts, is more important than learning the language as a tool. However, in Bhatia's mind the most important aspect of professional genres is their interdiscursivity—the large-scale mixing and embedding of genres, and even the "bending" of generic conventions. All of these lead to his conclusion that only by combining various theories and frameworks can one have a clear vision of the whole.

As to how he keeps his skills current and his interest in his career ongoing, his reply is that he constantly thinks about the issues that arise from analyses and keeps asking himself and others questions such as: Why do professionals write the way they do? What makes the forms they use successful? and his so often repeated question, "so what?" Although commenting that the search is never ending he insists that in his mind, even the little insight he has gained has spurred him on. Already he is quite excited about the notion

of interdiscursivity in professional genres, even working toward a manuscript on interdiscursivity in professional genres. His confidence is that the development of what he terms “critical genre theory” will prove to be a powerful tool to explore the appropriation of generic resources across genres, professional practices, and professional cultures. With such a questing spirit, no doubt his presence will be felt in the discourse community for years to come!

Bialystok, Ellen

GIGI LUK

Ellen Bialystok (1948–) is a Distinguished Research Professor in the Department of Psychology at York University, Toronto, Canada. She has bridged studies of language and cognition through her investigation of bilingualism. Her pioneering interdisciplinary research examines the cognitive consequences of bilingualism both in linguistic and non-linguistic domains across the lifespan. Most notably, Professor Bialystok has reported a bilingual advantage in tasks assessing executive function, which is a set of skills that are necessary for planning, cognitive flexibility, suppressing distracting information, and selectively attending to relevant information. These research findings have significant implications for education, linguistics, cognitive science, psychology, and neurology.

After completing her PhD at the University of Toronto in 1976, Bialystok acted as a project director and an assistant professor at her alma mater. She joined the Department of Psychology at York University in Toronto in 1982 as an associate professor. In 2001, she was appointed associate scientist at the Rotman Research Institute at Baycrest, a geriatric hospital affiliated with the University of Toronto. Her prolific research has been recognized in multiple disciplines, as reflected in recent awards from the Canada Council for the Arts (Killam Prize for Social Sciences, 2010; Killam Research Fellowship, 2001), York University (President's Research Award of Merit, 2009; Faculty of Arts and Faculty of Health Merit Awards, 2000–2009; Dean's Award for Outstanding Research, 2002; Walter L. Gordon Research Fellowship, 1999), Natural Sciences and Engineering Research Council of Canada (Top 50 Discovery List, 2006), and Baycrest Centre for Geriatric Care (Donald T. Stuss Annual Award for Research Excellence, 2005). Bialystok became a fellow of the Royal Society of Canada and a distinguished research professor at York University in 2003.

Bialystok's early research focused on second language acquisition in children and adults, particularly the processes involved in reading development and communication strategies. These early findings have important educational implications in classrooms with an increasing number of bilingual students. Language acquisition is not a static process but requires continual interaction between knowledge of language forms and functions. The ability to understand the abstract relations between language forms and functions is collectively referred to as metalinguistic awareness. Importantly, Bialystok showed that children who grow up in a bilingual environment have advanced development in metalinguistic awareness. However, depending on the languages these bilingual children speak, they may have weaker knowledge of language forms because of less intensive exposure in each language. At the same time, bilingual children develop better knowledge of language functions because of their diverse experience with multiple languages. These findings were published in a series of scientific articles in the 1980s (Bialystok, 1981, 1987a, 1987b, 1988, 1989). From these studies, Bialystok proposed that metalinguistic awareness relies on the knowledge of language forms that are abstract symbolic *representations* of sound and meaning. In addition, the ability to manipulate this knowledge is maintained by cognitive *control* that may also be involved in non-language processes. Bilingual children outperformed their monolingual peers in developing these cognitive control skills but showed some weakness in knowledge of language representation. The distinctions between representation and control were also applied to studies of adults' production as instantiated in communication strategies (Bialystok,

1990) and introduced a general psycholinguistic perspective on issues such as proficiency. The research on these distinctions further set the stage for understanding the distinct cognitive consequences of bilingualism in linguistic and nonlinguistic domains.

Why does language experience, such as bilingualism, affect cognition? According to Bialystok, this observation is a consequence of constantly managing attention to one of the two languages in a bilingual's mind. This experience affects a language-general cognitive mechanism that allows bilinguals to outperform their monolingual peers in executive functions tasks that require cognitive control. This mechanism is proposed to be language-general because bilinguals who speak any pair of languages need to recruit this mechanism. An example of Bialystok's early investigation on the bilingual advantage was shown with the *moving word task* (Bialystok, 1999). This task specifically taps into young children's understanding of meaning constancy in printed words by associating them with pictures that are either consistent or inconsistent with the meaning of the words. When the meaning of the words and the pictures were inconsistent, Bialystok found that bilingual children were better at ignoring the distracting picture and focusing on the meaning of the words. The interpretation is that bilingual children are better at inhibitory control of attention resulting in less interference from distracting information.

Following the investigation of inhibitory control of attention in the moving word task for young children, Bialystok continued to examine this cognitive benefit in bilinguals with nonverbal tasks to isolate the often-reported bilingual disadvantage in tasks requiring processing of verbal or linguistic stimuli. To this end, Bialystok assessed executive functioning using computerized tasks that she designed with nonverbal stimuli. For instance, she had adopted the Simon task paradigm to include squares with two colors. In the Simon task, participants are required to respond to presented stimuli (press left button when a red shape is presented, press right button when a green shape is presented). Congruent trials are characterized by the congruence between the correct response and the position in which the stimulus is presented, for example, a red shape presented on the left, and incongruent trials by incompatible spatial presentation, for instance, a red shape presented on the right. This task requires minimal processing of language and performance was least influenced by language proficiency, which is typically associated with a bilingual disadvantage.

In addition to examining the influence of bilingualism on cognition in children, Bialystok has expanded her bilingualism research to other age groups, including young and older adults, comprising the major developmental stages across the lifespan. Using tasks that do not require processing of verbal or linguistic stimuli, such as the Simon task, Bialystok has successfully identified bilingualism as a contributing factor to cognitive advantages in executive functions, such as cognitive flexibility (Bialystok & Martin, 2004; Martin-Rhee & Bialystok, 2008), suppression of distracting information (Bialystok, Craik, Klein, & Viswanathan, 2004; Bialystok & Senman, 2004; Bialystok & Shapero, 2005; Bialystok, Craik, & Ryan, 2006) and the ability to focus attention on one task (Bialystok, Craik, & Ruocco, 2006). One common characteristic of the task conditions in which a bilingual advantage was found is that there is a need to inhibit distracting information, which is often presented as an alternative response. This characteristic is rather similar to the situation in which a bilingual has to continually ignore interference from the language that is not in use. The critical point is the extended practice of focusing attention to one language in bilinguals resulting in enhanced cognitive control even when dealing with nonlinguistic stimuli.

The findings of a bilingual advantage in executive functions in adults, especially older adults, have important clinical implications, particularly in dementia research. Bialystok and her collaborators evaluated clinical records of patients who showed signs of cognitive impairments and divided them into monolinguals and bilinguals (Bialystok, Craik, & Freedman, 2007). These two groups of patients were comparable in gender distribution, cognitive performance at the time of first interview, and their occupation status. Nonetheless,

the bilinguals showed symptoms of dementia about four years later than that observed in the monolinguals. This substantial delay in onset age was interpreted as evidence for cognitive reserve slowing down age-related cognitive decline. One of the factors contributing to cognitive reserve is stimulating mental activity, such as higher education, musical training, or having an active lifestyle. In this case, Bialystok and her colleagues have successfully identified speaking two languages as one of these activities that show direct benefits in protecting against cognitive decline.

Aside from examining the positive influences of bilingualism on cognition, Bialystok has also investigated linguistic disadvantages due to bilingualism. Handling multiple representational systems for the same object or concept becomes a cognitive burden. This cognitive burden arising from the bilingual experience is both the source of the cognitive advantage and linguistic disadvantage reported in bilingual studies. In a large-scale aggregated analysis, Bialystok and colleagues have compared monolingual and bilingual children's performance on an English standardized receptive vocabulary task (Bialystok, Luk, Peets, & Yang, 2010). Vocabulary is typically measured by administering standardized tests, such as the Peabody Picture Vocabulary Test (PPVT) (Dunn & Dunn, 1997), which requires participants to match one of four line drawings to a word spoken by the examiner. Overall, bilingual children attained lower scores across the age groups, consistent with previous studies. To identify a possible explanation for bilinguals' lower performance in receptive vocabulary, Bialystok and colleagues performed a preliminary item analysis on PPVT in a subsample of six-year-old monolingual and bilingual children. The results suggested that the bilinguals achieved lower performance only in words that they usually encountered at home but not in words that are typically introduced in a classroom. This demonstrates that bilingual children may have weaker receptive vocabulary in one of their spoken languages because of less intensive exposure to one of the two languages.

Professor Bialystok has significantly advanced the fields of applied linguistics as well as of cognitive science by bridging the study of language and cognition through bilingualism. A bilingual mind houses two language representations which need to be handled efficiently. The experience of managing two languages in turn enhances a general cognitive mechanism that is not language specific. Bialystok has provided evidence for this observation throughout the lifespan. These compelling results from studying the bilingual population suggest that language processing is not domain-specific. Most notably, the observation that language experience changes performance in executive functions lends support to the proposal that human cognition is plastic and experience shapes cognition. The research on bilingualism conducted by Professor Bialystok has had a decisive influence on theory and applications in multiple disciplines.

Bias in Language Assessment

CATHERINE ELDER

Background

The study of bias in language assessment (as in other areas of educational measurement) is bound up with notions of fairness or disadvantage affecting particular groups of test takers. Bias is only one dimension of test fairness, as Xi (2010) amongst others has pointed out, and it is important to distinguish it from group differences in test outcomes that result from social circumstances beyond the test. The notion of bias, as discussed in this entry, has to do with the internal properties of a test and its component items and has been defined as “systematic error that disadvantages the test performance of one group” (Shephard, Camilli, & Averil, 1981).

Interest in the question of bias dates back to the era of IQ tests (Binet & Simon, 1916), which consistently showed inferior performance amongst those with low socioeconomic status due to factors later claimed to have more to do with opportunities to learn than with latent intelligence or mental capacity. This had obvious implications for both validity and fairness, and led to the quest for assessment instruments that were neutral in the sense of being free of undue bias or influence from variables extraneous to the construct under test.

Studies in language testing have identified variable sources of such bias, including gender, instructional experience, background knowledge associated with particular disciplinary areas, first language background, and ethnicity of particular test-taker groups. Bias may also stem from the interaction between these groups and the raters responsible for scoring test performance. This entry first discusses a priori approaches to bias detection, whereby efforts are made at the test design stage to avoid the selection of test content or testing formats likely to disadvantage particular groups of test takers, and then proceeds to an account of post hoc analyses of item performance and of rater behavior carried out with the aim of identifying (and eventually removing or minimizing) error of measurement where this is found to result in systematic overestimation or underestimation of the ability of the subgroups of interest.

Avoiding Bias in Test Design

It is customary in the process of developing any language test to make efforts to preempt the possibility that the choice of content for a test might be offensive and hence have a potentially biasing effect on the performance of particular subgroups within the target population. Scrutiny of test content occurs routinely during the normal text and item paneling process, and sometimes more formally, via a carefully selected bias review committee. Some companies, such as the Educational Testing Service (ETS) in the USA, publish fairness guidelines (Educational Testing Service, 2009) to guide test developers in avoiding unfair content or images in tests as they are developed. Such content might involve gender stereotyping, inappropriate labeling of ethnic groups, reference to distressing incidents or controversial topics, use of graphs that may be unduly difficult for candidates with

limited numeracy, or specialized words that might disadvantage those without relevant technical knowledge. Fairness guidelines are likely to include caveats to the effect that inclusion of such content may sometimes be central to valid measurement of the ability in question—a reminder that bias needs always to be determined in relation to the purpose of testing. For example, in an English test for health professionals it may be necessary and indeed critical to include specialized medical terminology.

Whether a priori monitoring of test content results in fairer tests, however, remains open to question, since test writers and vetters may have limited insight into what could stand in the way of valid measurement for different groups of test takers. Ross and Okabe (2006), for example, show that a priori subjective screening of test items by a panel of EFL (English as a foreign language) teachers is not necessarily an accurate means of predicting statistical bias.

Statistical Investigations of Bias

Statistical evidence as well as judgment is required to support substantive claims of bias. Evidence of overall performance differences between groups is not necessarily relevant, since such discrepancies may well be a reflection of real differences with respect to the construct of concern. Efforts are therefore made to institute ability controls such that comparisons are made between groups who are demonstrably *of equal standing* with respect to the ability of interest (American Educational Research Association, American Psychological Association, and National Council on Measurement in Education, 1999). If these matched ability groups perform differently on particular tasks or test items for reasons which are deemed by expert judges to have little to do with the relevant group's latent ability, then the resultant score differences can be confidently attributed to bias.

Differential Item Functioning (DIF)

The term “DIF” is often used in relation to statistical investigations of group differences at the item level, and such investigations are common in language assessment contexts. An item that displays DIF is one in which two or more groups, otherwise matched in ability on the construct of interest, have different probabilities of answering correctly (Fern & Rupp, 2007). This may be an indication of unfair bias. DIF studies involve analysis of differences in performance at the item level between a *focal* group (often a disadvantaged minority) and a *reference* group, which serves as the norm or benchmark for comparison. Matching of groups is generally based on the total test score, or on some external criterion deemed to be measuring the same or a similar construct.

The decision about which groups to target for comparison is usually determined a priori, either on the basis of research-driven hypotheses about factors in test takers' background that might be predicted to influence the way they tackle test items, or in response to actual disadvantage of one group compared to another. Language background is the most common focus of DIF studies in language testing (see studies by Elder, McNamara, & Congdon, 2003; Abbott, 2007; Roever, 2007) because psychological and social factors such as L1 transfer (whether negative or positive) and L2 exposure are likely vary between different L1 groups. Other grouping variables explored in language testing contexts include gender (Takala & Kaftandjieva, 2000), age (Geranpayeh & Kunnan, 2007), and academic discipline (Pae, 2004).

As for the object of language-related DIF analysis, investigations have focused most frequently on dichotomously scored tests of grammar, vocabulary, or both (e.g., Jang & Roussos, 2009), of pragmatic competence (Roever, 2007), and of reading and listening comprehension (e.g., Abbott, 2007; Pae, 2004, Geranpayeh & Kunnan, 2007). DIF studies

of polytomously scored speaking and writing assessments are less common (but see Kim, 2001; Elder et al., 2003; Lee et al. 2004). The tests investigated thus far include high-stakes English selection tests like the TOEFL (Test of English as a Foreign Language) and other locally developed instruments in various languages for diagnosis, placement, or the measurement of language proficiency/learning achievement.

A range of statistical methods has been used for calculating DIF in language tests. McNamara and Roever (2004) review different approaches, including the nonparametric Mantel-Haenzel and standardization procedures, IRT and logistic regression, with reference to particular language testing studies. Method selection may depend on sample size and item type (dichotomous versus polytomous), and some methods lend themselves better to the detection of *nonuniform* DIF (i.e., differential functioning which manifests only at certain score levels). Triangulation of methods can produce more robust outcomes and has now become standard practice in language testing research.

When interpreting DIF results, it is important to remember that DIF analyses are only the first step in any bias analysis and the presence of DIF is not ipso facto grounds for removing or revising a test item or excluding it in the reporting of test performance. Items displaying DIF need to be carefully scrutinized before it can be concluded that they are measuring candidates unfairly. Methods for determining sources of DIF generally involve post hoc inspection of the potentially offending items, usually by expert panels. In some cases it will be concluded that the different pattern of responses on the item is in fact evidence not of bias but rather of benign or construct-relevant differences indicative of a genuine proficiency gap between the groups of interest. Chen and Henning (1985), for example, found that Spanish test takers performed better than their Chinese counterparts on English vocabulary items which were cognate with Spanish. Should this be interpreted as unfair bias in their favor? No. It was concluded that such items were not overrepresented on the test and were a legitimate part of the corpus of English words that all proficient learners could be expected to have mastered, regardless of the difficulty such items might present for certain L1 groups. Conversely, it may be argued that an item is measuring a secondary dimension of the targeted ability, such as cultural background knowledge, unrelated or only tenuously related to the test construct (e.g., see Roever's 2007 discussion of the "Is the Pope Catholic" item on his ESL [English as a second language] pragmatics test). In the latter case the problematic item might be either removed or revised, on the grounds that it will unfairly disadvantage one or other group of test takers.

While determinations of construct relevance are always central to bias investigation and to decision making about subsequent action, the size of DIF (conventionally classified as negligible, moderate, or large) is also an important consideration. So too is the direction of DIF, given that an advantage for one group on some items can be neutralized by a disadvantage on others and hence may not have any practical impact. For example, Takala and Kaftandjieva's (2000) gender-based analysis of test takers' responses on a test of English vocabulary revealed an approximately even number of DIF items favoring male and female test takers respectively, such that overall scores for either group were unlikely to be affected. On the other hand, a large-scale multimethod study by Pae and Park (2006), exploring gender bias on the language component of a Korean scholastic aptitude test, showed that item-level DIF, regardless of direction, could have a substantial impact on overall test outcomes. In this latter case the DIF items, if found to be measuring skills unrelated to the test construct, might need to be revised or removed from the test to ensure valid outcomes for both groups.

Other practical applications of language-related DIF investigations are to inform item writers about avoidance of bias in future test versions (Uiterwijk & Vallen, 2005), to determine the fairness of a test for a particular population (e.g., whether immigrants can be validly measured by a test designed for L1 learners; Ockey, 2007), or to explore the impact

on the test construct of including test accommodations (such as reading aloud the input material from a reading comprehension test for students with disabilities; Bolt & Yesseldyke, 2006).

Rater Bias

The popularity of performance testing in the field of language assessment has resulted in greater attention to the potential for rater bias in judging test takers' speech and writing. Here the focus is less on the response patterns of test takers than on the way scores have been assigned. As with DIF items, the orientation of particular raters or groups of raters can work to inflate or depress test taker scores for individuals or groups in a way that may not be conducive to fair and valid measurement.

The study of rater bias falls within the class of differential facet functioning (DFF). Developments in MFRM (multifaceted Rasch measurement) along with methods such as CTT (classical test theory) and G-theory (generalizability theory) have been particularly useful in allowing investigation of how a particular facet of the test situation (e.g., choice of prompt, rating method, candidate identity), or multiple facets in combination, can elicit a biased or deviant pattern of responses from raters.

Language testing research has identified biased rating patterns on the part of novice raters compared to experts (e.g., Weigle, 2002), language versus discipline specialists (e.g., Brown, 1995), and native versus non-native speakers (e.g., Kim, 2009). The findings of such studies have practical implications for the design of tasks and rating scales, for rater training and rater choice.

As with DIF research, the findings of rater bias studies raise difficult validity questions. If subject-specialist raters on an LSP (language for specific purposes) test, for example, show consistent bias in relation to a particular feature of the rating scale, what is to say that this rating pattern is less defensible than that of the language experts, given that the subject specialist may be more aware of what matters for effective communication in the context of concern? Bias analysis may simply reveal different but equally defensible orientations to language rather than sources of unfairness. And even where biases are deemed invalid, they are not always amenable to correction. Rater training studies have shown that raters' responsiveness to feedback on their biased behavior is highly variable and does not always improve even when this feedback is presented to them over successive test administrations (see for example Knoch, 2011). The solution may therefore be to ensure appropriate groupings of raters to ensure representation of the different orientations to language in the real-world situation that the test is designed to reflect and to minimize the possibility that a test taker's score will vary according to the rater or class of raters that he or she is assigned to.

Limitations and Challenges

A limitation in both item and rater bias studies is the selection of groups used as the basis for comparison. Notions of nativeness and expertise, for example, are notoriously difficult to define, and boundaries between groups are often arbitrary. In addition, a variable like language background may be a surrogate for a host of other cultural, background knowledge, instructional, and experiential factors, which might offer better explanations of biases in item functioning or rating behavior than the overarching grouping category. Until these variables are disentangled, explanations of why bias occurs will remain hard to pin down. Rather than deciding on groups ahead of time, latent or mixed-class models may prove useful in exploring what new groupings of test takers or raters can reveal about the processes of answering test questions or judging test responses (Zumbo, 2007).

A further intractable problem with DIF studies is that language proficiency or any other relevant criterion for matching or comparing groups may itself be biased. Test-internal analyses, where the total test score is used as the criterion, take for granted the collective fairness of all test items. MFRM methods are not devoid of such problems either, since they compute bias as a deviation from what is predicted by the measurement model, itself merely a summation of the error-prone behaviors of individuals or groups. The choice of an external criterion, where this is used as the benchmark for bias determination, may likewise be predicated on an unwarranted assumption of neutrality and lead to decisions or actions that are at odds with fairness. (See Elder, 1997, for a discussion of one such case.)

Test constructs, as McNamara and Roever (2004) point out, are contestable and so too are expert opinions about what particular items are measuring or why they are functioning differently for particular groups. It has already been noted that a priori predictions of bias made at the test development stage are unreliable, and the same can be said for post hoc analyses of statistically flagged items (Geranpayeh & Kunnan, 2007). Abbott (2007) has proposed that better results may be obtained from a confirmatory rather than exploratory approach to item inspection, whereby judges are asked to categorize differentially functioning items or item bundles according to a conceptual language-processing framework established in advance of the bias screening process. Wolf and Leon (2009) show how exploratory and confirmatory approaches can fruitfully be combined in an exploration of the link between the linguistic demands of math and science test items and the performance of ELL (English-language learner) students on large-scale content assessments. Roever (2007) advocates mixed-method investigations involving think-aloud protocols from test takers in conjunction with expert judgment to further illuminate the basis for test-taker responses and assist decisions about whether these are integral or extraneous to the test construct. The practicality of this latter approach in operational testing situations is, however, questionable.

Fern and Rupp (1997) point out that there is thus far little consensus from DIF studies about factors which might cause bias in language tests, and hence little guidance can be offered to test developers about how to avoid it. Likewise, attempts to predict sources of bias in rater behavior may always be context-dependent, varying according to the purpose and content of the test and the particular populations involved in its implementation.

Conclusion

Bias threatens the validity of all evaluative exercises and researching and monitoring it in all forms of language assessment is a worthy enterprise, integral to the validation process and to the notion of professionalism in our field. It is to be hoped that increased rigor in this area of research, including more transparent and replicable research designs (as advocated by Fern & Rupp, 2007), may lead to refinements in language test development and administration that reduce the margin of error associated with test scores and result in fairer outcomes for test takers. The notion of “absence of bias” in language assessment is, however, chimerical, and documents setting out professional standards and codes of practice in our field, if they are to be more than simply aspirational, would do well to be circumspect in their claims about what is achievable.

Biber, Douglas

DWIGHT ATKINSON

Douglas Biber is a linguist who has spearheaded the computerized analysis of large, systematically constructed text corpora, yielding new and more sophisticated ways of understanding language and its use. His *multidimensional* approach to analyzing discourse, which examines co-occurrence patterns of large numbers of linguistic features across a broad range of spoken and written texts, has been highly influential in applied linguistics, sociolinguistics, and English linguistics. Biber also led the intensive, multiyear effort to produce *The Longman Grammar of Spoken and Written English* (Biber, Johansson, Leech, Conrad, & Finegan, 1999), a major academic grammar of English based on corpus findings. He has been active in developing pedagogical applications of corpus-analytic results as well.

Education

Biber was born in 1952 and grew up around Pittsburgh, Pennsylvania, USA. His father was a research physicist in the steel industry; his mother was a housewife. Biber attended local public schools, where he was attracted to math and science. Following high school he attended the Pennsylvania State University, majoring in geophysics.

On graduating from college, Biber worked as an oil-industry geophysicist for a year. He had taken linguistics courses in college and found them interesting, so at the end of the year he decided to try linguistics. He enrolled in a master's program at the University of Texas, Austin, which had a highly theoretical (i.e., Chomskyan) linguistics program, but after one year moved to the University of Texas, Arlington (UT Arlington).

As one of the few non-Chomskyan US linguistics programs in the 1970s, UT Arlington promoted linguistic traditions such as tagmemics, systemic functional linguistics, and text linguistics which were outside the US mainstream. One of Biber's early influences was Robert Longacre, who analyzed texts in terms of narrative structure and its linguistic correlates. The linguists at UT Arlington were also serious field linguists; as a result they had large amounts of primary language data. Biber was encouraged to work with these data—he produced his first two publications at this time, on the phonology of Mexican tone languages. On leaving UT Arlington with a master's degree, Biber had a strong background in functional, structural, and field linguistics, and a strong orientation as a researcher.

Biber went to work for a UNESCO-sponsored program in northern Kenya promoting mother-tongue literacy in the minority Somali community there. Biber's job was to prepare reading and teaching materials on linguistic principles and to train teachers to use those materials. As a result, Biber spent much of his time traveling the countryside, interacting with nomadic groups, and collecting linguistic data. He stayed in Kenya for three years.

In 1980, Biber decided to return to the USA to do a doctorate. He received admission to a well-known African linguistics program, but through interaction with the phonologist Larry Hyman ended up at the University of Southern California (USC). At USC, Biber was exposed to a rich and varied learning environment. Based on his literacy work in Kenya, he developed an interest in spoken versus written language differences. To support this interest, Biber's dissertation advisor, Edward Finegan, obtained the Brown Corpus of

American written academic prose (Francis & Kučera, 1982) and the London–Lund Corpus of British speech (Svartvik & Quirk, 1980)—the first two major computerized corpora of English. At the same time, Biber was required to take statistics courses as part of his linguistics training, during which he learned statistical procedures such as factor analysis. Biber also studied computer programming in the new Speech Science and Technology Program at USC, and in his third and final year there was employed as a full-time computer programmer by the university.

Biber's dissertation combined these influences in a highly innovative way. Based on an exhaustive review of functional linguistic descriptions of English speech and writing, Biber wrote a computer program which processed the Brown and London–Lund corpora, assigning grammatical "tags" (i.e., part-of-speech labels, often with additional information included) to the words and expressions it identified. Biber then calculated normalized/standardized frequencies of these features and factor-analyzed the results to obtain multiple dimensions of variation across all the texts analyzed. This represented the birth of Biber's influential multidimensional (MD) approach to computerized text analysis. An abbreviated version of his dissertation was published in the prestigious journal *Language* (Biber, 1986), garnering him attention from linguists both in the USA and abroad.

Major Contributions

Multidimensional Analysis

Biber's (1988) *Variation Across Speech and Writing* was a thorough reworking of his dissertation. By automatically counting the frequency of 67 functional linguistic features in a 1-million-word corpus comprised 23 genres of spoken and written texts and then factor-analyzing the results, Biber derived five major dimensions of variation across the texts analyzed. These dimensions were assigned labels based on the shared linguistic/communicative functions of the features making them up:

1. informational versus involved production,
2. narrative versus nonnarrative concerns,
3. situation-dependent versus explicit reference,
4. overt expression of persuasion, and
5. abstract versus nonabstract information.

(An example of a functional linguistic feature is the first-person pronoun, which loaded on the "involved" side of the "informational versus involved production" factor.) Biber then compared the text groups studied (e.g., natural-science academic prose; face-to-face conversations) on these dimensions depending on their combined frequency counts (appropriately normalized and standardized) for each dimension.

The general results of Biber's analysis were clear: There are few if any absolute differences between spoken and written language—on some dimensions, there are written texts which pattern more like some spoken texts than other written texts, and vice versa. On the involved versus informational production dimension, for instance, personal letters are closer to face-to-face conversation at the "involved" end of the dimension, while academic prose and official documents are arrayed at the informational end. Likewise, the relationship between different text groups typically changes across dimensions—for example, face-to-face conversation and academic prose are widely separated on the involved versus informational production dimension but are closely allied on the overt expression of persuasion dimension. On this basis, Biber argued that "speech" and "writing" are by no means monolithic constructs, and need to be studied in more sensitive and detailed ways.

Following his 1984 graduation from USC, Biber proceeded to apply MD analysis and related approaches in a number of innovative projects. Hired by the university with a dual appointment in linguistics and speech science and technology, he worked closely in this period with Edward Finegan. They coauthored several major publications, including corpus analyses of stance (Biber & Finegan, 1989a) and the historical evolution of English registers (Biber & Finegan, 1989b), and coedited a volume, *Sociolinguistic Perspectives on Register* (Biber & Finegan, 1994).

In 1988, Biber obtained a four-year grant from the US National Science Foundation (NSF) to build and analyze a corpus of Somali speech and writing. One interesting aspect of this work was that it documented the initial development of written registers in Somali, which had formerly been essentially an oral language, from 1973 to 1977 (Biber & Hared, 1994; Biber, 1995).

In 1990, Biber and Finegan obtained an NSF grant to construct “A Representative Corpus of Historical English Registers” (ARCHER), a project which occupied a significant amount of Biber’s attention over the next few years. The resulting corpus covered 10 historical English registers from 1650 to 1990, and contained 1.5 million words (Biber, Finegan, & Atkinson, 1994). Biber’s 1995 book, *Dimensions of Register Variation: A Cross-Linguistic Comparison*, featured comparative MD analyses of Korean, Somali, Nukulaelae Tuvaluan, and English, with the Somali data coming from his Somali corpus and the English data from ARCHER. Biber has continued to use ARCHER in more recent work (e.g., 2004).

Longman Grammar of Spoken and Written English

In the early 1990s, Biber assembled an international team of corpus linguists for the purpose of writing a descriptive grammar of English on functional and corpus principles. This monumental project yielded *The Longman Grammar of Spoken and Written English* (or *LGSWE*—Biber et al., 1999). *LGSWE* is based on the 20-million-word Longman Corpus of English, which is derived from 37,000 texts in four main registers—conversation, fiction, news reporting, and academic prose. Several large supplementary corpora were also analyzed for this project.

LGSWE is based squarely on the assumption that language varies fundamentally according to the situations in which and communicative purposes for which it is used. The corpus-based analysis of real language across a wide variety of situations of use is therefore *LGSWE*’s most distinctive contribution, and its grounding in a large, systematically constructed text corpus gives it the authority that only a strong and broad empirical basis can provide. Grammatical explanations are clear and detailed, sometimes confirming long-held beliefs regarding variation in language use but often yielding surprising insights. *LGSWE* has been welcomed by the English linguistics community as a revolutionary addition to existing academic grammars, and by the applied linguistics community as a prize asset in designing teaching materials that reflect real language use rather than the intuitions or prescriptive biases of their producers.

More Recent Work

Working alone and with colleagues, Biber has produced a steady stream of books, articles, and chapters in recent years. Biber, Conrad, and Reppen (1998) is a pioneering textbook on corpus linguistic approaches to language use which covers both substantive findings and analytic methods. Biber (2006) is a corpus analysis of spoken and written registers in US university contexts. Biber, Connor, and Upton (2007) seeks to reconcile classic discourse analysis with discovering generalizable patterns from corpus studies, and is one of the first books of its kind in the field. Biber and Conrad (2009) sets out new views on the major conceptual categories of register, genre, and style and their relationships.

In the last-mentioned book and several recent papers (e.g., Biber, 2009), Biber has argued that there actually is at least one important difference between speech and writing. While written texts can be produced that have essentially all the characteristics of spoken texts—thus supporting the position that there is no absolute difference between speech and writing—the converse is not true: Certain written texts, and especially academic registers, have linguistic characteristics such as complex noun phrases and phrasal modifiers (versus modifying clauses) that cannot practically be implemented in speech due to online production limitations.

Other recent work has focused on the concept of *lexical bundles*—co-occurring sets of three or more words that distinctively mark registers according to their frequencies of occurrence. Biber, Conrad, and Cortes (2004), for example, found that lexical bundles occur at quite different levels of frequency in teachers' classroom speech versus textbooks despite their overlapping communicative purposes.

Biber has also worked steadily on pedagogical applications of corpus linguistics. These include a student version of *LGSWE* (Biber, Conrad, & Leech, 2002) and an accompanying workbook (Conrad, Biber, & Leech, 2002). A corpus-based ESL grammar textbook (Conrad & Biber, 2009) is the first of its kind—previous corpus-based ESL textbooks focused on vocabulary.

Recent Career

In 1990, Biber moved from USC to Northern Arizona University in Flagstaff, Arizona, where he is currently Regents' Professor of Applied Linguistics in the Department of English. An avid outdoorsman and climber, Biber takes full advantage of the many natural wonders of the US West. He is also a much-sought-after speaker and consultant and travels incessantly. Biber has been extremely influential in the growth of general and applied corpus linguistics (a full list of publications is available on Biber's Web site, <http://jan.ucc.nau.edu/~biber/>). Besides his voluminous writings and several monumental projects, a substantial number of former doctoral advisees now holding academic positions in the US and abroad testifies to this fact.

Bible Translation

ERNST WENDLAND AND PHILIP NOSS

Introduction

The Bible is the most translated and retranslated book in the world. The process of Bible translation involves a complex, multidisciplinary effort that is aimed at rendering what is in essence a library of diverse literary genres in the various world languages. It consists of the 39 books of the Hebrew Scriptures (Old Testament, OT), the 27 books of the Greek New Testament (NT), and an Apocrypha or Deuterocanon (DC) of up to 15 books depending on the church tradition. The practice of Bible translation is at once a science, an art, a craft, and a technology that benefits most from a team approach.

A number of applied and theoretical fields of linguistics and biblical studies are employed in the translation exercise, together with other disciplines, including anthropology, sociology, pragmatics, intercultural communication, orality studies, and literary studies. This sustained enterprise is sometimes carried on for many years. In order to understand and appreciate the multifaceted character of Bible translation, it may be helpful to view the process from several perspectives, including its past history and accomplishments to the present day, the main theories that inform Bible translation, the practical principles and procedures whereby it is accomplished, and some of the chief ways in which applied linguistics and related studies contribute to this worldwide endeavor.

High Points in the History of Bible Translation

A recent major collection of scholarly essays variously surveys the history of Bible translation through the ages (Noss, 2007). Here we can draw attention to only a few key developments that have highlighted its progress over the past two and a half millennia. The first translations of the Hebrew Bible, also known as the Tanakh, were largely informal and resulted from Israel's period of exile in Babylon around the fifth century BC, when Aramaic gradually became the lingua franca of the Middle East. As the Hebrew language grew less familiar to a majority of the people, oral translations or paraphrases of the text, often accompanied by commentaries, were made by the rabbis. These *Targumim* (sg. *Targum*) were later written down and became more or less standardized in different collections and versions (Wegner, 1999, pp. 201–2). A widely used Targum, known as the Samaritan Pentateuch, was rendered in Syriac, a dialect of Aramaic.

Between 250 and 100 BC, the first translation of the Hebrew Bible was made in *koiné* Greek, the common language of the Mediterranean world. It is known as the Septuagint (LXX, from the Latin meaning “seventy”) because it was allegedly prepared by 70 Jewish scholars. It included the “apocryphal” or deuterocanonical books, and this became a significant factor in the later choice of formally authorized books that constitute the Christian canon. Because this first major translation of the Scriptures was the “Bible” used and referenced in citation by most NT writers, it was highly influential in the development of Christian vocabulary and theology.

After Aramaic and Greek, Latin became the language of wider communication in the increasingly Christianized Western world, especially in northern frontier regions of the

Roman Empire. Latin served as the vernacular for another prominent early translation, the Vulgate (*vulgata* meaning ‘common’). The OT translation, dating from around AD 405, was rendered from the original Hebrew by Jerome (Eusebius Hieronymus), while the Greek NT and DC books were probably translated by his protégé, Rufinus the Syrian (Burke, 2007, p. 85). Jerome was distinct in his stated endeavor to render the sense of the original text, instead of reproducing the literal form. Although he did not always succeed in this effort, his version became the Bible of the Western Church for the next 1,000 years.

The Septuagint and the Vulgate are considered to be primary versions, having been translated from the original languages. A number of secondary and tertiary versions based on primary and secondary versions, respectively, appeared in the early years of Christianity (ca. AD 400–1000). Translations based mostly on the Greek tradition were produced from the third to the seventh century in the Coptic languages of Egypt, in the Nubian language of what is today northern Sudan, and in Ethiopic, or Ge’ez.

Armenia became the first officially declared Christian nation in the fourth century. The languages of Scripture and liturgy were Syriac and Greek until a monk named Mesrop Mashtots devised an orthography and translated the Bible into Armenian in the fifth century. Bishop Wulfila (Ulfilas in Greek), a Goth born about AD 311 north of the Black Sea, together with a team of assistants, translated the Scriptures from Greek into Gothic so literally that the syntax was more Greek than Gothic. Because of his concern regarding the warlike tendencies of his countrymen, he omitted the translation of the Books of Kings.

Members of the Assyrian Church of the East, often referred to as the Nestorians, carried the Scriptures in Syriac eastward to India and across Central Asia to China where they produced the first translations in Chinese in the seventh century.

In the ninth century two brothers, Cyril and Methodius, completed a translation for the Slavic people in Moravia and Bulgaria. Although none of the original manuscripts survive, their translation from Greek was the beginning of Bible translation in Old Church Slavonic. A later translation became the first printed edition in 1581. Early in the 18th century, Peter the Great ordered a major revision of the Bible in Church Slavonic. Completed and printed in 1751 under Empress Elizabeth, it is known as the “Bible of Elizabeth.” This is the official liturgical Bible of the Orthodox Churches of Slavic tradition up to the present time.

The “middle ages” of Bible translation in the West roughly cover the period from Martin Luther’s German Bible in 1534 to the publication of the English Revised Version in 1885. As with the Latin Vulgate, Luther’s revolutionary translation was preceded by earlier versions in the language, but his rendition was distinct in several crucial respects. First, it was based on the original languages, including the new 1516 Erasmus edition of the Greek New Testament. Second, its language was more standardized, contemporary, literary, idiomatic, and sound-sensitive than earlier German translations. Third, Luther’s translation benefited from a scholarly review committee, and fourth, it was carried out according to explicit principles of meaning-oriented translation. The widespread influence of the Luther Bible in Germany soon extended to all countries affected by the Reformation, leading to new Protestant as well as Catholic translations in the principal languages of Europe.

John Wycliffe led the production of the first Bible in Middle English in 1383, but it was a secondary version, based on the Latin Vulgate, and it was a hand-copied edition. Over 100 years later, John Tyndale, whose translation convictions ultimately occasioned his martyrdom, was inspired and influenced by Luther to render the first New Testament in English based on the Greek text (1526), but with reference also to the German version. This led to the first complete English Bible published by Miles Coverdale in 1535. Several other English Bibles appeared in subsequent years, most under the influence of Tyndale’s translation, until the publication of the great, royally sponsored “authorized version” of 1611, commonly known as the “King James Version.” A series of revisions reflecting textual, translational, and linguistic factors followed over the years, culminating in the

widely accepted English Revised Version (NT published in 1881; OT published in 1885), the first translation to take into serious consideration the modern principles of textual criticism. A Catholic tradition of translation in English was initiated by the Douay–Rheims (or Rheims–Douai) Bible. Based on the Latin Vulgate, the NT appeared in 1582 and the OT with DC books in 1609–10.

The 20th century occasioned a significant expansion of Bible translation efforts all over the world. In most Western countries, this was the age of major revisions and new translations. The latter half of the century marked the rise of several influential idiomatic versions and paraphrases, among them, Today’s English Version (TEV, 1966), now known as the Good News Translation (GNT, 1992), and the Living Bible (1971).

The “missionary age” of translations when missionaries generally controlled the overall translation process extended through most of the 18th to the mid-20th century and resulted in relatively literal versions in many languages of South America, Africa, and the Asia-Pacific region. Sparked by the popular TEV, a large number of “common language” translations were completed in the major world regions by a variety of translation organizations (see below). Today, translation projects are normally carried out by highly trained mother-tongue speakers and are accompanied by literacy and new reader programs.

The first decade of the 21st century has been characterized by a more eclectic and flexible translation approach that normally makes use of a greater number of supplementary aids such as explanatory notes and glossaries, newer publishing formats, and multimedia text delivery systems. Frequently, such projects are guided by extensive preliminary research into the specific needs and desires of the local language communities concerned. Bible translation in any language is a never-ending task due to new scientific discoveries and the practical factor of constant linguistic and sociocultural change, as well as the religious desirability of having each new generation and speech community confront the challenge of thoroughly investigating and clearly communicating the Scriptures for themselves in their local circumstances.

Results of Bible Translation

During the first 1,800 years of the Christian era, at least one book of the Bible was translated into some 70 languages. Another 460 languages were added in the 19th century, and nearly four times that many (1,768) during the 20th century despite two world wars and other major conflicts (Hill, 2006, p. 82). By the end of 2009, at least a portion of Scripture had been translated and published in 2,508 of the world’s languages; however, only 459 languages possessed a complete Bible, and of these only 132 included the DC books.

The founding of the British and Foreign Bible Society in 1804 and the rise of the Bible Society movement during the 19th century greatly facilitated the translation, publication, and distribution of vernacular Scriptures. Some of the principal agencies involved in the current worldwide effort are the following: Wycliffe Bible Translators, also known by their academic arm SIL International, the United Bible Societies (UBS), Pioneer Bible Translators, Lutheran Bible Translators, and Word for the World, among many others. Of the world’s estimated 6,900 living languages, spoken by some 7 billion people (Lewis, 2009), well over 4,000 lack any portion of Scripture at all. Of these, current estimates suggest that around 350 million people speaking 2,250 languages do not have access to Scripture texts in a language they understand, whether in print, audio, audiovisual, or electronic form. Translation programs are currently under way in 1,990 of these remaining languages.

The original biblical texts were written in languages that possessed writing systems and a cadre of literate persons, often members of the priestly class. The earliest translations were into Greek and Latin, literary languages of international stature. Translation of the

Bible into a previously unwritten language provides a major impetus for the development of a writing system that is a precursor to a literate society.

Mesrop, for example, is credited with creating the alphabet that he used for the first translation of the Bible into Armenian. Bishop Wulfila wanted to have the Scriptures in Gothic, and this meant that he would need to create an alphabet and write this previously unwritten language. The “apostles of the Slavs,” Cyril and Methodius, faced the same challenge for their Slavic dialect. With Cyril’s Glogolitic alphabet, later followed by Cyrillic, it was possible to write the Slavic language translation that he, his brother, and their friends produced.

From these early examples to languages like German, English, Yoruba, Malagasy, and many others, the requirements of literature have led to the promotion of literacy and new reader materials, the production of dictionaries and related reference works, language standardization, the stimulation of national literatures, advances in translation theory and training, experimentation in machine-adapted translation, as well as other significant aspects of sociocultural and educational development.

Theories of Translation

Some 200 years ago, the German theologian and philosopher Friedrich Schleiermacher summed up the essence of translation, religious or secular, in terms of two basic alternatives: “Either the translator leaves the author in peace, as much as possible, and moves the reader towards him; or he leaves the reader in peace, as much as possible, and moves the author towards him” (Lefevere, 1977, p. 74). Like all popular generalizations, this observation involves an oversimplification and, possibly, a certain degree of misrepresentation. As J. Ellington has observed,

Any attempt by translators to take the reader all the way to the writer is doomed to frustrate and alienate the average reader; yet any endeavor to take the writer all the way to the reader risks trivializing the message and creating disinterest. (2003, p. 317)

All translations fall somewhere along a continuum between a form-focused “literalistic” (foreignized, formal correspondence) rendition and a meaning-oriented “paraphrastic” (domesticated, functional equivalence) version.

Theories employed to support a particular approach to the translation task, whether more or less foreignized/domesticated, tend to be grounded in one or more of these fields of investigation: communication studies, comparative literature, discourse analysis, or cognitive processes (Munday, 2009, pp. 20–73). The following paragraphs briefly describe six prominent models and methods that explicitly or implicitly inform the work of contemporary Bible translation, each exemplified by a recognized proponent or practitioner (Wendland, 2004, pp. 42–80):

Literalist: Writing about his translation, E. Fox explains, “Rather than carrying across (‘translating’) the content of the text from one linguistic realm to another, I have tried to involve the reader in the experience of giving it back (‘rendering’), of returning to the source and recreating some of its richness” (1995, p. xxv). Unfortunately, however, the reader has to be fairly well acquainted with the original languages of Scripture in order to appreciate the results of this formalistic methodology in his or her mother tongue.

Text-linguistic: This approach treats translation from the broad perspective of register analysis, comparative pragmatics, semiotics, intertextuality, and discourse texture and

types, with special emphasis on the key notion of “markedness,” that is, linguistic distinctiveness. Thus, the less stylistically marked, or in Hatim and Mason’s words, “the less evaluative the text is, the less need there will be for its structure to be modified in translation. Conversely, the more evaluative the text is, the more scope there may be for modification” (1990, p. 187). The various poetic genres in the Scriptures would fit into the latter category.

Interpretive: According to M. Lederer, “The interpretive theory . . . holds that the process [of translation] consists in understanding the original text by deverbalizing its linguistic form, and in re-expressing in another language the ideas that were understood and the feelings that were felt” (1994, p. 11, in Sterk, 2004, p. 131). This conception of translation is similar to the three-step dynamic equivalence approach of analysis, transfer, and restructuring applied in Bible translation by Nida and Taber (1969, p. 33).

Pragmatic: The approach of relevance theory foregrounds one of the Gricean maxims of successful communication (Hatim & Mason, 1990, p. 62), namely, “relevance,” which, according to E.-A. Gutt “is seen as the *cost–benefit* relation of processing effort spent versus contextual effects obtained” (1992, p. 24, 2000, pp. 31–5). The principal aim is to achieve adequate interpretive effect with minimal processing effort. According to relevance theory, an “indirect translation” is designed to function on its own and may be freely modified, in terms of making implicit information explicit, to achieve maximal relevance for its intended user. A “direct translation,” on the other hand, seeks to achieve the closest possible identification with the source-language text, such as the Scriptures (Munday, 2009, p. 220).

Functionalist: This category covers several approaches that have been employed in Bible translation. Speech act theory, for example, proposes that the culturally determined nature of any text that is part of a given oral or written communication event “determines the interpretation of an utterance as performing a particular speech act” (Yule, 1996, p. 48). The sociosemiotic and sociolinguistic orientation of functional equivalence holds that “the translator must seek to employ a functionally equivalent set of forms which in so far as possible will match the meaning of the original source-language text” (De Waard & Nida, 1986, p. 36). This perspective has been expanded with a special emphasis on capitalizing on the literary (oratorical) resources of the target language, that is, in a “literary functional equivalence” (*LiFE*) version (Wendland, 2004, pp. 369–79, 2011, pp. 109–11). Finally, C. Nord develops *Skopostheorie* as a theory of intercultural “communicative action” (1997, pp. 22–3). This theory takes the entire operation of a translation project into consideration in the negotiated “brief,” that is, its overall guiding job commission (p. 30), and the *Skopos*, the principal purpose for which the translation is made for a particular constituency (p. 29).

Cognitive: This approach also applies to all phases of a translation project, from its initial organization to its postpublication testing, with respect to the culturally determined mental models, or representations, that influence all aspects of textual and contextual perception and interpretation. This process may be broken down into a set of conceptually overlapping and mutually interacting “frames of reference,” namely cognitive, sociocultural, organizational, conversational, textual, and lexical (Wilt & Wendland, 2008). These interrelated, contextually prioritized and arranged perspectives on the world of one’s experience “frame” the communicative act of Bible translation with reference to the original text as well as its rendering in another language and culture (worldview, way of life, value system, etc.). Therefore, “translations, which normally involve transfer of meaning not just across language but also across culture, will be interpreted in the light of different frames from those of the original author and audience. This means that a translation must do more than duplicate words, it must duplicate the situational frames those words originally referred to” (Hoyle, 2008, p. 7).

Practical Principles and Procedures

Many manuals and workbooks are available that survey, exemplify, and put into practice the major principles and procedures of Bible translation according to the general communication theory that has been adopted (e.g., Nida & Taber, 1969; Barnwell, 1986; De Waard & Nida, 1986; Gutt, 2000; Wilt & Wendland, 2008). Therefore, we will simply highlight by way of a series of questions some of the important issues pertaining to this multifaceted process that need to be considered by the translation community:

- *Canon*: Which books of Christian Scriptures are to be translated, only the 66 authorized texts of the Protestant canon, or will the additional books of the Catholic or Orthodox Deuterocanon be included?
- *Text*: Which text of the original Scriptures is to be used as the primary translation base (e.g., the Hebrew Masoretic Text; the Greek text published by the United Bible Societies), and how are important text critical problems to be decided in cases of controversy?
- *Brief*: What are the principles in terms of organizational structure and management policies that will guide and govern the project, and what will its principal communicative goal (*Skopos*) be in view of the intended audience? In light of the preceding, how will translators and support staff be trained and equipped to fulfill their respective assignments?
- *Modus operandi*: How will members of the translation team and review committees be coordinated to operate together in harmony during the process of composing, cross-checking, reviewing, testing, revising, and publishing the various draft texts?
- *Methodology*: What are the specific translation guidelines and techniques that will be adopted to handle the various translation problems that may arise, especially in areas of possible disagreement (e.g., how to handle crucial key terms and technical vocabulary)?
- *Training and technology*: Which courses of study are available to train translators and to progressively improve their skills? What tools and resources are on hand, or are still needed, to sufficiently equip the translators to carry out their work (e.g., Bible commentaries, lexicons, translation handbooks and journals, computer programs and equipment, access to the Internet for information and interaction)?
- *Engagement*: How will the project organizers or translation agency involved promote full and accurate use among individuals and churches of the translation portions that are being produced and the complete version that is eventually published (e.g., testing draft portions, organizing seminars on Scripture interpretation and application, holding classes in Bible schools and seminaries)?

Some Essential Applications of Applied Linguistics in Bible Translation

As Bible translation efforts continue to multiply in manifold ways the world over, a number of issues pertaining to applied linguistics and related studies maintain their relevance, some with greater urgency now than in the past. Our survey concludes with a summary of these major areas of ongoing research, testing, and information sharing:

Dialectology: It is not only a matter of deciding whether a certain language and speech community is still viable for supporting a new Bible translation (or revision). A project must also determine which dialect and sociolect would provide the most widely acceptable linguistic basis for any version under consideration. In addition, research is needed into areas such as the appropriate level of language for the group concerned, the use of ideologically sensitive terms such as those for race and gender, and the possibility of

functionally matching the literary genres and linguistic styles of the biblical texts with genres and styles of the translation language.

Paratext: A project must decide which supplementary helps (e.g., cross-references, marginal notes, book and chapter introductions, illustrations, glossary entries, a basic concordance or index) are most necessary to increase the average person's comprehension of the biblical text. Corresponding equivalents for nonprint media productions, such as aural or video Scriptures, must also be determined, plus how to coordinate all these auxiliary aids so that they complement the biblical text itself.

Format: Printed Bibles are still the most popular by far, although how much they are actually used in comparison with other media is debatable. In any case, the standard format for publishing Bibles is relatively dense and unwelcoming to the reader. Research is needed to discover how the text can be displayed to promote greater legibility and intelligibility (e.g., larger type, a single print column, unjustified right margins, the use of strategic space on the page).

Orality: This factor closely relates to the preceding issue in that the Scriptures are meant to be heard aloud, and therefore translations must be carefully composed with the crucial oral–aural dimension in mind. The Bible is heard much more often than it is read by individuals from a printed page; therefore it is logical that the characteristics of orality should be given prime consideration during the entire production process.

Technology: New developments in electronic media are making correspondingly novel platforms for Scripture publication and distribution available (e.g., via the ubiquitous Internet and personal cell phones). Ongoing analysis will be needed to evaluate the effectiveness of new media in these ever-changing technologies compared to older media (e.g., print, audio, audiovisual). Present tools and resources may need to be improved to better serve the translators on ongoing training and in the performance of their everyday tasks (e.g., UBS: Paratext; SIL: Translator's Workplace, Biblical Analysis Research Tool [BART]).

Biblical illiteracy: This is proving to be one of the most challenging current issues in the field of Bible translation. There are two major concerns: first, how to accurately discern and document the widespread phenomenon of general ignorance about the content and setting of the Scriptures; second, how to effectively combat this deficiency by providing a more suitable hermeneutical context for understanding, one that is appropriate both for the medium of transmission and for the intended audience group.

There is every indication that, in addition to its contribution to intercultural communication and increased knowledge of the biblical text, the multidisciplinary effort of Bible translation will continue to enrich and be enriched by all the fields of academic and practical study that it engages.

Bilingual and Monolingual Language Modes

FRANÇOIS GROSJEAN

Bilinguals communicate differently when they are with monolinguals and when they are with bilinguals who share their languages. Whereas they avoid using their other language(s) with monolinguals, they may call upon it (or them) when interacting with bilinguals, either by changing over completely to the other language(s) or by bringing elements of the other language(s) into the language they are speaking.

This change of behavior, which affects both language production and language perception, has been alluded to by well established researchers over the years. Thus, Weinreich (1966), one of the founding fathers of bilingualism research, wrote in his classic book, *Languages in Contact*, that bilinguals limit interferences when speaking to monolinguals (he used “interference” as a cover term for any element of the other language), whereas, when speaking to other bilinguals, they use them freely. Other researchers such as Hasselmo (1970) and Baetens Beardsmore (1986) have made similar points. Grosjean has investigated this phenomenon—language mode—in a series of publications (Grosjean, 1985, 1989, 1994; see Grosjean, 2001, 2008, for reviews).

Language Mode

Description

Language mode is the state of activation of the bilingual’s languages and language-processing mechanisms at a given point in time. Figure 1 illustrates the concept which is best presented as a continuum in a two-dimensional representation. The bilingual’s two languages (A and B) are depicted on the vertical axis by squares.

Figure 1 A visual representation of the language-mode continuum

Note. Two positions on the continuum are illustrated for a person with two languages (A and B): toward the monolingual end (on the left) and toward the bilingual end (on the right). The level of activation of a language (square) is depicted by the degree of darkness (black represents an active language and white an inactive or deactivated one).

2 BILINGUAL AND MONOLINGUAL LANGUAGE MODES

Two positions on the continuum are illustrated in the figure. In both positions, language A is the most active (it is the main language being used, or base language, hence the black square) and language B is active to varying degrees. On the left, language B is only very slightly active (lighter square), and the bilingual is said to be at, or close to, a monolingual language mode. On the right, language B is active (darker square), but it is not as active as language A, and the bilingual is said to be in a bilingual mode. (To simplify matters, we will mention only two languages at this point, but language mode applies also to three or more languages, as we will see below.)

Bilinguals will usually be in a monolingual mode (left part of the figure) when they are interacting with monolinguals with whom they simply cannot use their other language (here, language B). They have to deactivate the latter, usually unconsciously, so that it is not produced and hence lead to a breakdown in communication. They can also be in a monolingual mode with other bilinguals if they have only one language in common. Bilinguals will be in a bilingual mode (right part of the figure) when interacting with other bilinguals who share their languages and with whom they feel comfortable bringing in the other language. In this case, both languages are active, but one language (language B here) is slightly less active as it is not the main language of communication. Bilinguals can also be in an intermediate mode (between the two end points), for instance when they know that their interlocutor is bilingual but does not like to mix languages. In this case, the other language (language B in the example) will be only partly activated. What has just been said about speakers applies to listeners; they can find themselves at various points along the continuum depending on what they are hearing as well as on situational factors such as knowing that they share the same two languages with their interlocutor.

Language mode is made up of two components. The first is the base language chosen (language A in the example) and the second is the comparative level of activation of the two languages—from very different in a monolingual mode (left part of figure) to quite similar in a bilingual mode (right part of figure). These two components are usually independent of one another—one can change without affecting the other. Thus, the base language can be changed but not the comparative level of activation of the two languages. This takes place, for example, in a bilingual interaction when a bilingual switches over completely to the other language (which becomes the base language). In the example above, language B would become totally active and language A slightly less active. Similarly, there can be a change in the level of activation of the two languages without a change in base language, as in Figure 1. Thus, when referring to language mode, both aspects need to be mentioned. For example, a Spanish–English bilingual speaking Spanish to a Spanish monolingual is in a “Spanish monolingual mode”; the same bilingual speaking English to another Spanish–English bilingual is in an “English bilingual mode,” and so on.

Movement Along the Language-Mode Continuum

A number of factors will influence a bilingual’s position on the continuum, and hence the activation level of the languages concerned. First, there are the participants involved, that is, their language proficiency, their relationship, their language-mixing habits and attitudes toward language mixing, their mode of interaction, and so forth. For example, the mode will be monolingual if a bilingual is interacting with a monolingual family member. Second, the situation of the interaction will influence language mode, that is, the physical location, the presence of monolinguals, the decorum, and so on. Dewaele (2001), for example, found that the formality of the situation turned out to be a crucial factor in determining the position of the speaker on the language-mode continuum. Third, the form and content of the message being uttered or listened to will have an impact on the mode. Thus, if the topic is usually covered in another language, and the interactant is known to be bilingual, the

bilingual speaker will slip into a bilingual mode so as to call upon the other language for a word or an expression. In such cases, the base language may even change. Finally, the function of the language act (to communicate information, to request something, to create a social distance, to exclude someone, etc.) may change the language mode.

Movement along the continuum can occur at any time when the above factors change. In addition, the movement is usually not conscious. Bilinguals will also differ among themselves as to the extent to which they travel along the continuum. Some are rarely at the bilingual end—they mainly communicate with monolinguals or remain within one language with bilinguals. Others, such as bilinguals who live in bilingual communities, rarely leave the bilingual end.

Impact on Language Behavior

The particular language mode bilinguals are in will have an effect on the amount of use of the other (guest) language, the amount and type of mixed language used, the ease of processing of the two languages, and the frequency of base-language change. For example, in the monolingual mode, the language not being used is deactivated. This prevents a change in base language and limits almost totally the use of code switches and borrowings. However, dynamic interferences—deviations from the language being spoken due to the influence of the other deactivated language(s)—may still take place. In the bilingual mode, bilinguals usually first adopt a base language through the process of language choice and, when needed, bring in the other—guest—language in the form of code switches and borrowings. In addition, the base language itself can be changed, that is, the slightly less activated language becomes the base language, and vice versa. A change of topic, of situation, of interlocutors, and so on, may lead to a change of base language. In perception, a monolingual mode will usually “block out” the other language, leading sometimes to misperceptions if the latter is used, or slower processing. Cheng and Howard (2008) examined the cost of language switching when it was unexpected in one context (monolingual mode) and expected in the other (bilingual mode). They showed a significant reaction-time difference in the two conditions, thereby illustrating the impact of language mode during perception.

Evidence for Language Mode

There is increasing evidence of the importance of language mode in bilingual communication. In language production, observational and experimental studies have shown its impact. Poplack (1981) showed that a member of El Barrio—a Puerto Rican neighborhood in New York—produced about four times more code switches in informal situations, compared to formal situations. Treffers-Daller (1998) placed a Turkish–German bilingual in three different situations and showed changes in the base language used as well as differences in the amount of code switching that took place. In a series of experimental studies, Grosjean and his colleagues (reported in Grosjean, 2008) manipulated the language mode participants were in using a “telephone chain” task, and studied the impact this had on language production. The number of guest-language elements (code switches, borrowings) increased significantly as the participants moved from a monolingual to a bilingual mode, whereas the number of base-language syllables decreased, as did the number of hesitations.

In perception, Elman, Diehl, and Buchwald (1977) carried out a categorical-perception study with bilinguals in which they controlled for the base language and “pushed” bilinguals toward the monolingual end of the language-mode continuum (they used naturally produced stimuli, filler words in the base language, as well as carrier sentences in either English or Spanish). They found a boundary shift, with ambiguous stimuli perceived

significantly more as English or as Spanish depending on the language condition listeners were in. In this study, unlike in an earlier study by Caramazza, Yeni-Komshian, Zurif, and Carbone (1973), there was constant language-specific information which activated one language much more than the other and hence kept the bilinguals toward the monolingual end of the continuum.

In language acquisition, there is increasing evidence of the importance of language mode. For example, Lanza (1992) studied a 2-year-old Norwegian–English bilingual child, Siri, interacting with her American mother who feigned the role of a monolingual and did not mix languages, and with her Norwegian father who accepted Siri’s language mixing and responded to it. Siri did much more content-word mixing with her father than with her mother, showing thereby that she leaned toward the monolingual end of the continuum with the latter and the bilingual end with the former. Genesee, Boivin, and Nicoladis (1996) recorded English–French bilingual children as they spoke to their mother, to their father, and to a stranger who only spoke their weaker language. The more a parent switched languages during communication, the more the child did too. Thus, as in Lanza’s study, children were more in a monolingual mode with parents who did not mix languages much, whereas they were more in a bilingual mode with parents who mixed languages to a greater extent (or accepted language mixing).

In the domain of language pathology, Marty and Grosjean (1998) manipulated language mode in a study that examined spoken-language production in eight French–German aphasic bilinguals. The latter were asked to carry out a certain number of language tasks by two different experimenters—the first was a totally monolingual French speaker who knew no German, and the second was a French–German bilingual. The patients knew about the experimenters’ language background before testing. The authors found that two patients could no longer control their language mode due to their pathology but the six others adapted their language behavior to the experimenter, that is they did not mix their languages with the monolingual experimenter (or, if they did do so, it was due to stress or fatigue).

Language Mode in Different Groups of Bilinguals

Studies of language mode have been carried out in relation to different groups of bilinguals. Four examples are given here.

Highly Language-Dominant Bilinguals

It has been reported repeatedly that highly dominant bilinguals (e.g., members of a minority group who rarely use the majority language, bilingual children who are strongly dominant in one language, second language learners who use their new language, etc.) do more language mixing when speaking their weaker language than they do when using their stronger language (Lanza, 1992; Genesee, Nicoladis, & Paradis, 1995). They do not seem to be able to control language mode when speaking their weaker language in the way less dominant, or balanced, bilinguals can. They attempt to deactivate their stronger language in a monolingual environment that requires the weaker language, but the latter may simply not be developed enough to allow them to stay in a monolingual mode. Hence, their stronger language is activated and it is used to help them out (see Grosjean, 2008).

Caixeta (2003) studied this experimentally with two groups of Brazilian Portuguese–French bilinguals, one advanced and one intermediate in their knowledge of French. They were tested individually, in French, on a number of tasks by two experimenters, a French monolingual and a French–Portuguese bilingual. Caixeta found that the participants who

had an intermediary level of French produced a greater percentage of guest elements than the advanced-level participants.

Multilinguals

People who know and use three or more languages also find themselves in various language modes (see Dewaele, 2001). For example, trilinguals are in a monolingual mode when the people they are interacting with are monolingual in one of their three languages, or when they share only one language with another bilingual or multilingual. They can be in a bilingual mode if they share two of their interlocutor's languages (e.g., languages B and C) and they feel comfortable bringing one of the languages (e.g., language C) into the base language (language B). If they are with trilinguals with whom they share all their languages, then the mode can be trilingual, with one language being the most active, for some period of time at least. What is true of trilinguals is also true of quadrilinguals. For example, a quadrilingual can be in a language-B monolingual mode where language B is being used (it is the base language) and languages A, C, and D are deactivated. This same person, in another situation, can be in a quadrilingual mode where, for example, language B is the base language and languages A, C, and D are also active.

Interpreters

To understand how interpreters undertake simultaneous interpretation, we have to call upon the languages involved but also upon their input and output mechanisms (Grosjean, 1997). Interpreters have to be in a bilingual mode where both languages are active. However, one language is not more active than the other as is normally the case in the bilingual mode. Here both the source language (the language being heard) and the target language (the language being spoken) are active to the same extent as both are needed, for perception and production respectively. This is relatively rare in normal bilingual communication. This said, the processing mechanisms differ according to the level of activation. The input mechanisms of both the source and the target language are active. The reason for the activation of the source mechanism is clear but why that of the target language? There are at least three reasons. Interpreters must be able to monitor their overt speech, the clients' occasional use of the target language must be processed, and the cues of fellow interpreters must be heard. As for the output mechanisms, only that of the target language is active; the source language's mechanism is not. The reason here is straightforward: Only one language has to be output—the target language.

Deaf Bilinguals

Like hearing bilinguals, deaf bilinguals find themselves in their everyday lives at various points along the language-mode continuum (Grosjean, 2010). When they are communicating with monolinguals they restrict themselves to just one language and are therefore in a monolingual mode. They deactivate the other language and remain, as best they can, within the confines of the language being used (for example, a written form of the majority language). At other times, deaf bilinguals find themselves in a bilingual mode, that is with other bilinguals who share to some extent their two languages—sign language and the majority language—and with whom they can mix their languages. They choose a base language—usually a form of sign language (the natural sign language of the community or a signed version of the spoken language). Then, according to various momentary needs, and by means of signing, finger spelling, mouthing, and so forth, they bring in the other language in the form of code switches or borrowings.

Language Mode in Research

Several research issues are related to language mode.

Language Mode as a Confounding Variable

Since language mode is a cognitive phenomenon that has its roots in human interaction, it is present in many research projects, but mostly in a covert way. The consequence is that the data obtained are variable due to the fact that participants are probably situated at various points along the language-mode continuum. In addition, the data can be ambiguous given the frequent confound between language mode and the variable under study. A few examples are examined below.

It is rare that researchers working on interferences/transfers put their bilingual participants in a strictly monolingual mode when they obtain language samples. This is unfortunate as they invariably obtain other contact phenomena such as borrowings and code switches which may not be of any interest in the study. For example, Marian and Kaushanskaya (2007) examined a database obtained in the study of autobiographical memories in bilinguals in order to observe crosslinguistic transfer and borrowing. The first author, herself also bilingual in Russian and English, interviewed all participants individually, in English in one session, and in Russian in the other. The participants were thus, *de facto*, in an intermediate language mode (they knew the experimenter was bilingual) and they brought in various types of contact phenomena. The types of phenomena would have been different and the number much less had participants been interviewed by monolinguals of the two languages.

A much researched psycholinguistic issue concerns the presence or absence of language-selective processing in bilinguals, that is whether bilinguals call on two (or more) languages when listening to, or reading, one language only. Beauvillain and Grainger (1987), for example, found evidence for nonselective lexical access when bilinguals were shown interlexical homographs. The problem, however, is that the bilingual participants in their experiment had to be in a bilingual mode to complete the task: They had to read a context word in one language and then decide whether the next word, always in the other language, was a word or not in that language. It is no surprise, therefore, that a result indicating nonselective processing was obtained. Many other studies which have failed to control for language mode sufficiently well have been carried out since then and there is now a growing myth that processing is nonselective (see, e.g., Dijkstra & van Hell, 2003, and its discussion in Grosjean, 2008). A close examination of the research situations, the methodologies, and the stimuli used in these studies leads one to conclude that most of the time the other language was being activated either by top-down or by bottom-up factors. Hence the nonselective processing found in experiments.

Finally, in the bilingual-language-development literature, it has been proposed by some that children who acquire two languages simultaneously go through an early fusion stage in which the languages are in fact one system (one lexicon, one grammar, etc.). They then slowly differentiate their languages, by separating first their lexicons and then their grammars. Evidence for this has come from the observation of language mixing in very young bilingual children and from the fact that there is a gradual reduction of mixing as the child grows older. However, according to researchers such as Genesee (1989), many of these children are in a bilingual mode when recorded, that is, the caretakers are usually bilingual themselves and they are probably overheard using both languages, if not actually mixing their languages (see Goodz, 1989). Thus, as with the other studies mentioned above, language mode is a confounding factor that impinges on the results obtained.

Language Mode as a Control Variable

Early attempts to control for language mode used two approaches, both of them inappropriate. The first was to put the participants in a “language set” (called by some a “language mode”) by giving them instructions in one language, getting them to carry out preliminary tasks in that language, occasionally presenting reminders in that language, and so forth. What this does is activate a particular base language (the variable depicted on the vertical axis in Figure 1), but it does not guarantee a particular position on the monolingual–bilingual-mode continuum. A second inappropriate approach, which has been used a lot with bilingual children, second language learners, and aphasic or demented patients, has been to hide the experimenter’s or interviewer’s bilingualism. This is a very dangerous strategy as subtle cues such as facial expression and body language can give away the interlocutor’s comprehension of the other language. In addition, it will not prevent occasional slipups such as responding in the “wrong” language or showing in one’s response that what has been said in that language has been understood. All this will simply move the participant into a bilingual mode and, once again, make language mode a confounding variable. (For a discussion of approaches to use to put participants in a monolingual mode as much as possible, see Grosjean, 2008.)

Modeling

Few models of bilingual language processing and language acquisition have taken into account language mode as of yet. For example, De Bot’s (1992) classic model of bilingual language production does not give a clear account of how language choice takes place (i.e., how the base language is chosen), how the language mode is set, and the impact it has on processing. Similarly, in the bilingual interactive activation (BIA) model (Dijkstra & van Heuven, 1998) one language is normally deactivated during the word-recognition process by means of top-down inhibition from the other language node and lateral inter-language word-level inhibition. This will produce satisfactory results for word recognition in the monolingual mode but it will be less than optimal when mixed language is being perceived. In the latter case, it would be better if both languages were active with one more active than the other. To our knowledge, the only computational model of word recognition that simulates language mode is the Léwy and Grosjean BIMOLA model (see Grosjean, 2008). Both the base-language setting (a discrete value) and the language-mode setting (a continuous value) can be set prior to simulation in this model.

Conclusion

Language mode helps us understand how bilinguals use their languages, separately or together, in everyday life, and it accounts for many findings in the research literature. It is invariably present as an independent, control, or confounding variable and hence needs to be heeded at all times.

Many aspects of language mode have to be studied further. For example, it will be important to isolate the factors that influence a particular mode, determine their importance, and ascertain how they interact with one another to activate or deactivate the bilingual’s languages, and hence change the bilingual’s position on the language-mode continuum. The maximum movement possible on the continuum will also have to be examined for various types of bilinguals. Another issue concerns the resting mode individuals find themselves in when there is no language activity taking place. Finally, language mode in multilingual situations will have to be studied further.

Bilingual and Multilingual Education: Overview

JASONE CENOZ

Introduction

Multilingualism is common in modern society due to different historical, social, political, and economic reasons. The beliefs, attitudes, and discourses of different societies are reflected in educational planning and specifically in language planning at school. Nowadays an increasing number of schools have multilingualism as one of their educational aims. Due to the international spread of English, education often aims at teaching English but also includes national languages and minority languages. Languages are learned, maintained, and reinforced through education. Schools can provide ample opportunities for the development of multilingualism because of the number of hours and years that children spend at school (Baker, 2007).

Many schools all over the world include more than one language in the curriculum either as school subjects or as languages of instruction. Learning foreign languages has a long tradition as part of elite education and modern languages such as English, French, or German have been taught along with other school subjects. Classical languages, such as Latin and Greek, are also part of the school curriculum in some countries. The teaching of foreign languages has spread to general education in many countries and English and in some areas French are the main languages of instruction in many former colonial countries in Africa and Asia. In these settings, English and French are associated with more prestige and Western society than African and Asian languages. Bilingual and multilingual education also refers to learning languages that have a weaker social status. This weaker status may be reflected in the limited number of speakers of the so-called minority languages (e.g., Frisian in the Netherlands or Navajo in the United States), or in their limited functions in society (e.g., Quechua in Peru or Berber in Morocco) even when the demography is strong.

Most research on bilingual and multilingual education has been carried out in Europe and North America but more recently Africa, Latin America, and Asia are also attracting more attention (De Mejía, 2005; Feng, 2007; Heugh & Skutnabb-Kangas, in press).

In this entry we look at different aspects of bilingual and multilingual education. First, the meaning of multilingual education as related to bilingual education and its scope are addressed. Then the diversity of multilingual education and the *continua of multilingual education* as a tool to compare multilingual programs are discussed. The next section, "The Outcomes of Multilingual Education," looks at the linguistic and cognitive effects of multilingual programs and "New perspectives in Multilingual Education" deals with new ways of communicative interaction among multilinguals and their challenges for multilingual education.

The Scope of Multilingual Education

Multilingual education refers to the use of two or more languages in education provided that schools aim at multilingualism and multiliteracy. This definition focuses on the aims of education and considers the goals of multilingualism and multiliteracy as a requirement. Therefore, multilingual education does not include situations in which bilingual and multilingual children speak languages other than the school language at home but do not get any support for their home languages at school. This is a very common situation in different parts of the world including the United States and Western Europe where many immigrant schoolchildren speak languages that are not part of the school curriculum.

We understand multilingual education (“multi” = many) as an umbrella term that includes bilingual education (“bi” = two) as its most common type but also refers to other types of multilingual education with three or more languages. Although trilingual education (or other forms of multilingual education with even more languages) is not as common as bilingual education, it can be found in different parts of the world (see Cenoz, 2009, chap. 2). In this entry we use “multilingual education” as a general term referring to two or more languages and we use “bilingual education” when referring specifically to two languages.

Definitions of bilingual education tend to consider the use of two languages as media of instruction, that is, the teaching of subject matter content in two languages, as a characteristic of bilingual education (Baker, 2007, p. 131; Skutnabb-Kangas & McCarty, 2008, p. 4; Cummins, 2008a, p. xiii; May, 2008, p. 20). For example, the different types of immersion programs in Canada use both French and English as languages of instruction at least at some point. However, there can be bilingual education programs in which only one language, the minority language is used as the language of instruction and the majority language is used as a subject. This is the case in some European programs in the Basque Country or Wales where the use of Basque or Welsh as the language of instruction counterbalances the low vitality of the minority language as compared to the vitality of Spanish or English. In these cases, it does not seem to be necessary to use the majority languages as languages of instruction because there is enough exposure to them outside the school and the majority languages are also taught as school subjects. These programs result in a more balanced bilingualism than when both the majority and the minority languages are used for the same amount of time in the school curriculum (Cenoz, 2009).

When more than two languages are involved, it is more difficult to use all the languages as languages of instruction even if the school aims at developing multilingualism and multiliteracy. Examples of multilingual education such as the European schools do not usually have three languages as languages of instruction but only two plus one or more languages as school subjects. Among the schools that can be considered multilingual because they aim at multilingualism and multiliteracy, some of them call themselves “trilingual” because they aim at developing communicative skills in three languages. There is a great diversity of schools regarding not only the languages of instruction used at school but also their target population. For example, in the Basque Country there are different programs aimed at the whole population with either Basque or Spanish as the language of instruction and in all of them English is a third language that can be taught as a subject or as additional language of instruction. Some trilingual schools are more elitist and are particularly aimed at expatriates and children of the upper classes as is the case of some international trilingual schools with languages such as Arab, French, and English in Arabic countries.

The great diversity of multilingual schools regarding the languages involved, the target population, and the use of the languages both as languages of instruction and school

subjects makes it difficult to establish fixed categories. In fact, it is even difficult to establish hard boundaries between bilingual schools where a third or fourth language is taught and schools that call themselves trilingual or multilingual.

Types of Multilingual Education

There are many different types of bilingual and multilingual education and Mackey (1970) already categorized 250 types of bilingual education. This diversity is related to the number of educational, linguistic, and sociolinguistic factors affecting multilingual education. According to the linguistic background of the students and the aims of the school some broad categories have been distinguished: transitional, maintenance, and enrichment programs (see for example May, 2008; Baker, 2011). *Transitional programs* aim at language shift from the child's first language to the majority language and imply cultural assimilation. According to our definition of multilingual education transitional programs cannot be considered examples of multilingual education because they do not aim at multilingualism and multiliteracy. In the case of *maintenance* and *enrichment* programs the second language does not replace the first. Furthermore, enrichment programs aim at developing linguistic diversity. Baker (2011, chap. 10) proposes a very well known typology that distinguishes strong and weak forms of bilingual education taking into account the language background of the child, the language of the classroom, and the linguistic, societal, and educational aims. Weak forms of bilingual education are not included in our definition of multilingual education because their goal is monolingualism or limited bilingualism. Strong forms of bilingual education include immersion for speakers of the majority language, maintenance/heritage-language programs, two-way/dual-language programs, and mainstream bilingual education in two majority languages for speakers of majority languages.

Typologies of bilingual education cannot always fit all the diverse types and specific cases found in schools in different parts of the world. This is even more difficult when educational programs go beyond two languages and aim at developing communicative competence in three or more languages. As an alternative, Cenoz (2009) proposes the "*continua of multilingual education*" as a more appropriate tool to deal with the diversity of multilingual education. Hornberger (2003, 2008) applied the idea of continua to biliteracy by using two-way arrows to represent "*infinity and fluidity of movement*" (Hornberger, 2008, p. 277). This idea of continua is used in the "*continua of multilingual education*" so as to provide a tool that can describe as many situations of multilingual education as possible.

As can be seen in Figure 1, the model places the educational continua inside a triangle because they are central to defining a school as multilingual. These "school" continua are linked to other external continua: linguistic distance and the sociolinguistic context.

When learning two or more languages the typological distance between the languages already known by the speaker (the first language/s or others) and the target language(s) can have an influence on the acquisition process (Cenoz, 2009). When languages are closely related to each other they tend to have considerable similarities in grammar, vocabulary or the phonological system. For example, Kowalski (2009, p. 175), an American multilingual speaker explains: "Once I was there, however, the language practically fell into my lap. For one thing, with Spanish and Latin already down, Italian fell in its turn like a domino."

Typological distance is a factor that has to be taken into account when analyzing different types of multilingual education, and languages are not only "related" or "unrelated" but there can also be different degrees in their relationship. For example Italian and English, being Indo-European languages, are more related to each other than to Japanese. The bidirectional continuum proposed in the *continua of multilingual education* for language distance can accommodate different combinations of languages. A school with Italian,

Figure 1 Continua of multilingual education. Cenoz (2009) © Multilingual Matters

English, and Japanese in the curriculum can be placed more toward the “more distant” end of the continuum than one with Italian, English, and French but more toward the “less distant” end of the continuum than one with English, Japanese, and Hebrew.

Apart from linguistic distance, the sociolinguistic environment in which a bilingual or multilingual school is placed needs to be taken into account. At the macro level, we can consider the relative status and vitality of the languages used at school, spoken by the students in society at large, or both. Factors such as the number of multilingual speakers, the status of the different languages, or their use in the media and the linguistic landscape can affect motivation to learn languages. For example Wildsmith-Cromarty (2009, p. 102) refers to status when discussing her experience learning Zulu: “the African languages have, until recently, carried no status in political, judicial, or educational domains so that there was no real incentive to learn them as additional languages.” The sociolinguistic context where a multilingual school is located can be more or less multilingual. For example, a multilingual school in Argentina is more toward the “less multilingual” end of the continuum than a multilingual school in India.

The languages used by schoolchildren at home with their parents, siblings or the extended family, their neighbors, and peers are also part of the sociolinguistic context at the micro level. This context can be more or less multilingual. For example, Fantini recollects his childhood as being more bilingual and according to the *continua of multilingual education* this situation would be more toward the multilingual end of this continuum than a child brought up in a monolingual home: “I know our Italian dialects were dominant in both the family and the neighborhood. I don’t remember anything specific about speaking Italian (or English, for that matter), but I know Italian was used as needed, otherwise English” (Fantini, 2009, p. 244).

The educational variables are four continua: subject, language of instruction, teacher, and school context. Languages can be school subjects but also languages of instruction. A high number of languages in the curriculum and their use as languages of instruction

place a school toward the multilingual end of the continuum. Other factors that can be considered when comparing multilingual schools are the intensity of language instruction, the age of introduction of the languages, or the integration of different languages in the curriculum. Teachers' communicative skills in different languages also contribute to make a school more multilingual as well as their specific training for multilingual education. A final factor that is considered to be in the school context is the use of different languages when teachers, supporting staff, students, and parents communicate outside the classroom in informal conversations and meetings. Literacy practices and the linguistic landscape inside the classrooms and in the school are also part of the school context. A school would be more multilingual if more languages are used for these functions. Freedman (2009, p. 139) recalls a school that would be toward the multilingual end of the continuum, "the school had an inherent multicultural character. Perhaps two-thirds of the students and some of the teachers spoke an African language (or several), in addition to French."

The "*continua of multilingual education*" can be used to compare different types of multilingual education within a country or internationally. This model can be more appropriate than traditional typologies to accommodate the diversity of multilingual education because it takes into consideration the effect of different factors but it proposes continua rather than closed categories so as to allow for comparison among different educational programs.

The Outcomes of Multilingual Education

Multilingual education, understood as education that aims at multilingualism and multi-literacy, entails good linguistic and academic results. This is the case both for speakers of a majority language and speakers of a minority language (or a language of low status) provided that there is an adequate development of the first language (May, 2008; Baker, 2011).

In general terms, research in immersion education for language-majority students has shown that students learn another language and acquire literacy skills at no cost to their overall academic achievement or their first language skills (see Baker, 2011). These results work for early total immersion but also for dual-language programs or two-way immersion programs, where students from language minority and majority backgrounds are in the same class and both languages are used as languages of instruction (Genesee & Riches, 2006). These results indicate that language-majority students who use the L1 on a daily basis outside school can have an L2 as a language of instruction at no cost for their L1 or for achievement in academic domains such as science, mathematics, and social studies. Proficiency in the L2 in immersion programs is higher in receptive skills than in productive skills. Students in early total immersion generally achieve higher levels of proficiency in the L2 than those in partial immersion but intensity of instruction also produces good results in some late immersion programs. In general terms, these results originally reported for Canadian immersion have been confirmed in other contexts (see May, 2008; see also IMMERSION EDUCATION).

In the case of speakers of minority languages or languages of low status, multilingual education that aims at maintaining and developing the first language along with other languages is associated with the best results not only in the L1 but also in the L2 and other areas of the curriculum. For example, a meta-analysis of research studies on minority children in the US reported by Genesee and Riches (2006) shows that learners who receive some reading instruction in the L1 in the primary grades achieve, at least, the same level of performance and in some cases even a higher level of performance in L2 reading than learners of similar linguistic and cultural backgrounds who have only received initial

literacy and instruction in English. López (2006) reports the successful transfer of key competences from indigenous first to the second language in Guatemala and Bolivia when first languages are used as languages of instruction. Good results in academic achievement and in classroom participation have also been reported (see, for example, López & Sichra, 2008). Mohanty (2006) points out that there are social psychological and educational benefits when the first language is maintained along with other languages in India (see also Young, 2009, on Macau). Heugh and Skutnabb-Kangas (in press) analyze several cases of multilingual education in countries such as Ethiopia, Burkina Faso, Peru, India, and Nepal, and conclude that mother-tongue education assists the content learning of other subjects but also other languages. These positive outcomes of maintaining and developing a minority language or a language of lower status at school have been confirmed in research studies conducted in many other parts of the world in diverse sociolinguistic and educational settings (see, for example, Cenoz & Gorter, 2008; Cummins & Hornberger, 2008).

New Perspectives in Multilingual Education

Multilingual education aims at developing multilingualism and multiliteracy but very often creates strong boundaries between languages by associating different languages to different teachers (one teacher, one language) or to different spaces (one classroom for each language). However, multilinguals use their languages as a resource and often mix them in daily communication with other multilinguals. The influence of some teaching methods has created isolation between the different languages in most school contexts but the interaction between the languages can be helpful in different ways (Cummins, 2008b). For example, multilingual students can use the languages they know to develop their metalinguistic awareness and make more progress when learning additional languages (Jessner, 2006). Nowadays, there is a trend toward a more multilingual approach in multilingual education, an approach that does not isolate languages. For example, Blackledge and Creese (2009) advocate for the flexible use of languages in school environments in order to focus on the speakers and not the languages and to look at their linguistic practice as related to the context in which they take place. In the same vein, García (2009) considers that pedagogical practices have to be built on the multimodal literacy practices that children bring to school and not on separate codes. In fact, new technologies have influenced communication and nowadays multimodality is increasingly important. Furthermore, elements from different languages are combined with other semiotic elements such as images, icons, or pictures. These networks of communication together with linguistic and cultural diversity in school settings pose new challenges for multilingual education.

Bilingual Education

OFELIA GARCÍA AND HEATHER HOMONOFF WOODLEY

Bilingual education is the use of two, or more, languages in the instruction and assessment of learners. Bilingual education differs from traditional language education programs that teach an additional language as a subject in that it uses the language as a medium of instruction. Programs vary in their goals, language use, and students served, and are also shaped by sociocultural and sociopolitical factors, historical context, as well as the status and power of speakers and languages.

Throughout the world, children of the elite are sent to bilingual schools for the purpose of learning prestigious languages—French, German, English, Chinese, Arabic, and others. However, in order to uphold linguistic hierarchies and maintain power, the masses have most often received monolingual education in the dominant language, which eventually leads to language shift and homogenization of differences.

The rise of global ethnic revivals in the mid-20th century, including civil rights movements in the United States, contributed to seeking greater educational opportunities for language minority populations. Universal education was extended to the masses through the inclusion of their languages in the educational system in the form of bilingual education programs. As we have moved into the 21st century, issues surrounding bilingual education today are more complex than in the past due to increased movement of people, technology, and the growing dynamism of bilingualism itself (García, 2009).

Recognizing that models of bilingual educations are artificial constructs divorced from the daily realities of school language use and learning, it is useful to look at different types of bilingual education. Various types of programs within bilingual education differ based on broad goals, contexts, and structures. One of the most elaborate, and best-known, typologies of bilingual education was proposed by William F. Mackey in 1970. Mackey's typology distinguishes 90 different variables depending on 4 intersecting factors:

1. The relationship between the language(s) of the home and the schools;
2. Curricular organization of the languages: the medium of education, their pattern of development, the distribution of the languages in the curriculum, the transition from one language to the other;
3. The linguistic character of the community and the country;
4. The function, status, and differences, both regionally and internationally, of the various languages.

In 1974 Wallace Lambert proposed what became the two classic models of viewing bilingualism in schools during the 20th century—*subtractive bilingualism* and *additive bilingualism*. Subtractive bilingualism is what happens when schools take away the home language of the child and substitute it with a majority language. Additive bilingualism, on the other hand, builds on the child's home language as the other language is acquired. However, these models of bilingualism have proven to be insufficient in the 21st century.

Subtractive bilingualism refers to the type of bilingualism promoted by *transitional bilingual education* models. These programs temporarily use the child's home language to facilitate the acquisition of a dominant language. The goal of these programs is to promote language shift to a majority language. Examples of transitional bilingual education programs can

be found in Peru, Guatemala, and Bolivia, where indigenous languages are used in the early grades before students' transition to Spanish-only classes. Throughout many countries in Africa, local languages are used in transitional bilingual education usually up to the third or fourth grade when the language of education becomes the colonial language. Transitional bilingual education programs are also often used to educate immigrant students, especially in the United States. Acting as "safe-houses" for recently arrived immigrant students, transitional bilingual education programs are ways of alleviating the culture shock, alienation, and educational inequity that immigrant students often face. In the United States, transitional bilingual education programs are the most popular type of bilingual education currently used in serving language-minority, mostly Spanish-speaking, students, although they are being replaced with mostly monolingual approaches.

In support of the *additive bilingualism* of children, different types of bilingual education programs have been developed throughout the world. However, most of these types of bilingual education programs follow a *monoglossic* language ideology, which expect the same language abilities as monolinguals in both languages. One type of bilingual education program under this framework is *maintenance bilingual education*. These are programs mostly serving empowered language-minority children who want to maintain their home language while developing proficiency in a dominant one. These programs reflect community and cultural values, self-determination, and emphasize a strong bicultural identity for learners.

Prestigious bilingual education programs use an additive approach in serving empowered language-majority children through the medium of two languages. Languages are often strictly separated, usually through the use of different teachers who teach diverse content in different languages. In many parts of the world there are American, British, German, and French bilingual private schools that fall under this type.

Immersion bilingual education is another additive type of bilingual education where, after a short period of time in which language-majority children are taught in the additional language, the home language is increasingly used until half of the instructional time is devoted to the home language and the other half to the additional language. These programs were first developed in Québec for Anglophone-majority children who wanted to become bilingual. There are *early immersion* programs that start in the very early grades, as well as *late immersion* programs that begin in middle or secondary schools. Although the first immersion programs in Québec were of the *full* type, meaning that students were exclusively taught initially in the additional language, there are also *partial* types in which the instruction is never exclusively in the additional language.

Toward the end of the 20th century, and into the 21st, the linguistic complexities of Africa and Asia, and of the Deaf community began to gain recognition in Western scholarship. This has resulted in a growing acceptance that bilingual learners have diverse languaging practices, rather than being two monolinguals in one, or all starting out as monolinguals. These *heteroglossic* linguistic practices and ideologies are shaping new theoretical frameworks of bilingual education based on the realization of multiple coexisting norms, which characterize bilingual speech and bilinguals' use of multiple discursive practices, and have begun to compete with monoglossic beliefs. This ideology of heteroglossia includes sociolinguistic aims of bilingual revitalization, bilingual development, and linguistic interrelationship, while also contributing to global awareness and enhanced choices and opportunities for communities and learners. As a result of these changes, García (2009) identified two further theoretical frameworks of bilingualism—*recursive bilingualism* and *dynamic bilingualism*, neither subtractive nor additive because of their non-linear heteroglossic nature.

A *recursive bilingual* framework recognizes the complex nature of the bilingualism of ethnolinguistic groups who have undergone language shift as they attempt language

revitalization. The idea is that these speakers do not start out as monolinguals, but reach back to the bits and pieces of the languaging practices that they still hold. *Immersion revitalization bilingual education* programs use this framework to move the languaging practices of these ethnolinguistic groups forward and into a bilingual future. In Aotearoa, New Zealand, the “language nests” schools known as Kōhanga Reo are early childhood centers where Māori young children interact with Māori speaking grandparents and community members. Kura kaupapa Māori are immersion revitalization bilingual education programs that emphasize incorporation of local Māori knowledge as well as language learning, while working toward group agency and power. These types of immersion revitalization bilingual education programs are also prevalent among other indigenous peoples, especially Hawaiian natives, Native Americans in the United States, Canada’s First Nations, and the Sāmis of Norway, Finland, and Sweden.

Developmental bilingual education programs also embody this *recursive framework* because the ethnolinguistic group is not monolingual to start with, but rather has a bilingual/multilingual concept of community, diverse language practices, and multiple identities. These programs are usually found in language minority communities that have undergone some degree of language loss, but have not suffered the language shift of those who need immersion revitalization bilingual education programs. Thus, the speakers in this group have a broad range of languaging practices. These programs differ from maintenance bilingual education programs that stem from a monoglossic ideology and only recognize monolingualism in both languages as a goal, as they are based on more flexible languaging practices. Developmental bilingual education programs recognize the cultural and linguistic diversity of their speakers and seek to serve non-dominant language students while both reaffirming and developing their minoritized language. Traditional or natural bilingual schools for Welsh speakers fall under this type. In the autonomous regions of Spain, Catalan, Galician, and Euskara (Basque) are used in different kinds of programs while recognizing the broad language continuum of its bilingual speakers. When Deaf bilingual education exists in the United States, most can be considered developmental bilingual education programs, recognizing the diversity of the Deaf community, some profoundly deaf, others hard of hearing, and yet others the product of the diverse success or failure of cochlear implants.

Under a *dynamic bilingual* framework within a heteroglossic language ideology, there is support for multiple language interactions that take place on different levels and planes including multimodalities, and other linguistic interrelationships. A dynamic form of bilingualism actively builds upon the multiple sense-making and discursive practices of bilinguals that García (2009) has termed *translanguaging*, extending the term coined by the Welsh Cyn Williams to refer to a particular type of multilingual pedagogy.

Bilingual education under this dynamic framework includes *poly-directional bilingual education* also known as *two-way bilingual education*, *two-way immersion*, *two-way dual language*, *bilingual immersion*, or *dual language*. These programs include children who have various language practices and are often from majority and minority groups. In the United States these programs are increasingly called “dual language,” a way of silencing the increasing bilingualism of the country. The Oyster School in Washington, DC, is one such example. The school immerses students with different language strengths (supposedly 50% English speakers and 50% speakers of the other language) with half the time studying in each language. In New York City, there are two-way bilingual education programs that educate students in English and either Spanish, Chinese, French, Russian, or Korean. The goals of these programs are bilingualism and biliteracy, as well as cultural understanding between groups. Neve-Shalom, Wahat Al-Salam in Israel, is an example of a two-way bilingual school that emphasizes peaceful cooperation and multicultural respect by having Jewish, Muslim, and Christian Israeli children study together with one Arab and one Jewish teacher

in Arabic and Hebrew. The European Schools for children of civil servants working in European institutions, where multiple languages are used in teaching and learning, are also examples of these poly-directional bilingual education programs. Although two-way bilingual education programs often have strict language separation arrangements and policies, in practice much translanguaging occurs, both by teachers and students.

In *Content and Learning Integrated Language (CLIL) bilingual education* programs an additional language is used as a medium to teach one or more subjects to the entire school population. These programs have been promoted especially in the European Union and replace traditional core language education programs. *CLIL-type* bilingual education programs have been spreading as a way to teach global languages.

Another dynamic form of bilingual education is *multiple multilingual bilingual education*. Increasingly, as more ways of languaging become recognized, bilingual education is not sufficient. A multiple multilingual bilingual education points to the greater complexity of language practices, recognizing more than two academic languages for literacy, but also a great range of languaging to make sense of learning. For example, in Luxembourg, all students participate in a trilingual education starting with the home language of Luxemburgish, followed by German language and literacy, and eventually French, which is then increasingly used as the medium of instruction. Translanguaging is a common feature of such teaching, as students and teachers negotiate meaning using all the languaging practices at their disposal. In other countries such as Singapore, the Philippines, India, Hong Kong, Morocco, Lebanon, and Algeria, various languages are used in schools and throughout an individual's educational experience.

Yet another dynamic form of bilingual education is what García and Kleifgen (2010) call *dynamic bi-/plurilingual education programs*. Whereas in the programs described above, the language practices in classrooms are rigidly controlled in top-down fashion by the school and classroom teacher, in these programs the new language is used in the education of students who then are given the agency to negotiate their linguistic repertoires. That is, the locus of control of the language rests with the students and there is a great deal of peer teaching. This type of program has become prevalent in some newcomer programs in the United States, especially in those known as international high schools for immigrant children.

Regardless of what type of bilingual education program a group or parent chooses for their children, one thing is clear. Bilingual education is the only way to educate children in the 21st century.

Bilingual Education and Immigration

VIV EDWARDS

Introduction

“Globalization”—or economic activity across national frontiers—is a relatively new term, usually applied to more recent population movements. The process to which it refers, however, started in the late 19th century, slowed in the period from the start of World War I, and has been gaining speed ever since, assisted by increasingly sophisticated communications and transport technologies (Education, Audiovisual, and Culture Executive Agency [ESCWA], 2008). From the 1960s, migration began to involve a wider range of sending and receiving countries (Spellman, 2002); since the late 1990s, the nature and extent of this migration have undergone further rapid changes. This new migration has been characterized by “super-diversity” or “the diversification of diversity” (Vertovec, 2006).

Because migration is an ongoing process, minority language communities are often very complex. To take just one example, Polish speakers in the UK belong to one of several diasporas: the wartime “Emigracja” between 1940 and 1950, composed mainly of the families of the Polish armed forces, refugees, and displaced persons; a small post-1950 migration, consisting in the main of anti-communists; a further small migration around 1980 from post-Solidarity Poland; and a large migration in the years following the enlargement of the European Union in 2004. The Emigracja and postwar diasporas encompass three generations, the Solidarity diaspora two generations, and the New Accession diaspora just one. The educational needs of children belonging to these diasporas are, of course, very different. The various groupings are, arguably, more strongly drawn together by linguistic and cultural ties than they are separated by their different migration histories and, for this reason, it is often impractical to discuss one group in isolation from the others. For the purposes of this article, however, the main focus will be on educational issues around multilingualism in the earlier stages of migration.

I will look first at the extent of linguistic diversity, and then consider a range of educational responses to speakers of other languages, including those of language minority speakers themselves. Next I will explore the different pedagogical approaches used in teaching speakers of other languages and, finally, the methods used to assess their learning.

A Note on Terminology

It is important to begin, though, with a brief consideration of terminology. As is often the case with more recent fields of study, there is considerable terminological confusion. In the USA, new arrivals speaking languages other than English are often defined in terms of what they lack (English) rather than what they have (fluency in another language), a state encapsulated in the term “limited English proficiency” or LEP. In Australia, the preferred term is speakers of “languages other than English” or LOTEs. In the UK, terms widely used include “second language learners” and “emergent bilinguals,” although official parlance now seems to have stabilized around speakers of “English as an additional language” (EAL).

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0092

There has been a similar vacillation around terminology for the languages which immigrants speak. In North America, discussions of both indigenous and more recently arrived immigrant languages are framed in terms of “heritage languages.” In the UK and Australia, the preferred term for more recently arrived languages is “community languages.” In addition, the terms “supplementary schools” and “complementary schools” tend to be used interchangeably in discussions of the non mainstream settings where these languages are taught. In this article, I will use the term “emergent bilingual” to avoid pathologizing new arrivals and stress instead both their actual achievements and their educational potential.

The Extent of Diversity

Population censuses—and particularly the Australian and Canadian censuses which are undertaken every 5 years—are useful sources of information on transnational flows of languages. In 2001 one in six Canadians reported speaking a language other than English or French at home; over 100 different languages were recorded. Five years later, the proportion of speakers of non official languages had risen from 18 to 20.1%, and the number of languages to more than 200. Chinese, Spanish, Punjabi, Urdu, Tagalog, and Arabic were the largest languages in terms of growth (Statistics Canada, 2009). The 2001 Australian census reported that 142 languages, in addition to Aboriginal languages, were spoken by just over one in six of the population. Five years later, the 2006 census recorded almost 400 different languages with a growth in speakers of Asian languages and a decline in speakers of European languages (Australian Bureau of Statistics, 2007). Even allowing for factors such as inconsistency in the naming of languages and differences in opinion as to what constitutes a language (Pennycook & Makoni, 2006), there can be little doubt either of the growth in the numbers of speakers of other languages or of the diversification in the languages involved.

School surveys are another useful source of information, especially in countries like the UK where questions on language are limited to Welsh in Wales, Gaelic in Scotland, and Irish in Northern Ireland. Statistics collected in 2007 by the Scottish Executive on the languages spoken by children at home and on community language teaching in England, Scotland, and Wales point to similar patterns in terms of the numbers of languages spoken and the diversification of these languages. They also highlight changes in the distribution of the languages. Although multilingualism has traditionally been an urban phenomenon, CILT (2005) gives the example of changing populations in two rural settings—the Scottish Borders where Portuguese- and Russian-speaking families have moved to work in the fishing industry, and Wrexham, a small town in northeast Wales where at least 25 languages are now spoken in schools, including Portuguese, Polish, Tagalog, and Shona.

The Educational Response

Patterns of educational provision for emergent bilinguals vary across time, both within and between countries. Nonetheless, it is possible to outline a number of broad trends which follow a similar chronological sequence. The main focus in this historical overview is on predominantly English-speaking countries in North America, the UK, and Australia, which, historically, were the main “receiving” nations. Similar trends, however, have been detected subsequently in many other destinations for immigrants.

Submersion

The response to the large population movements following World War II was one of *laissez-faire*: The unquestioned assumption was that children would “pick up” the new language in the playground. It was some time before the consequences of inaction were finally acknowledged: Far too many children were sinking rather than swimming. In the USA, minority language speakers resorted increasingly to legal means to redress the situation (Del Valle, 2003), ultimately paving the way for the provision of bilingual education (see below).

In England during the 1960s, teaching of new arrivals took place in special reception centers or “withdrawal classes” in the same school; here the sole emphasis was on learning English. In Australia, the Child Migrant Education Program was set up in 1971 to address similar needs. Students were withdrawn from mainstream classes for specialist English teaching for one or two lessons each day (Davison, 2001). Initially, segregated provision was justified on the grounds of administrative convenience; its educational value was not questioned. Over time, however, there was growing unease about the effectiveness of this policy. Concerns focused on the need for the social integration of new arrivals (Swann, 1985), the restricted curriculum resulting from the focus on language rather than content, and the limited opportunities for language learning in classrooms where the only native English speaker was the teacher (Commission for Racial Equality, 1986).

Mainstreaming

The move from separate to integrated provision started in the mid-1980s in the USA, Canada, Australia, and all current member states of the European Union and the European Economic Area. In some cases, pupils are directly integrated into classes where they receive special language support; in other cases, they are kept separate for a limited period and receive tuition adapted to their needs. In most of the countries in question, both kinds of provision exist alongside each other (ESCWA, 2008).

The motivation for mainstreaming is both philosophical and pedagogical. The philosophical rationale concerns the benefits that accrue to both minority and majority populations, and is reflected in a wide variety of policy statements (see, for instance, Swann, 1985). The pedagogical dimension will be discussed below.

Bilingual Education

The mainstreaming of emergent bilinguals is, however, by no means without its critics. This course of action is likely, for instance, to result in *subtractive* bilingualism, whereby the learning of the second language replaces the first language in children’s repertoire. Many writers argue instead for the individual and societal benefits of *additive* bilingualism offered by bilingual education (see Baker, 2006, for an overview of this issue). Critics also point to the evidence that the longer children receive instruction in their first language, the better the educational outcome.

Of particular note in this respect are two large-scale longitudinal studies of children in US schools. The first of these studies examined the progress of 2,000 children over 4 years in three kinds of program—English only; early-exit bilingual programs, where the home language is used for transitional support in the first 2 years of school; and late-exit, where instruction in the home language continues alongside English throughout elementary school. Late-exit programs were the most beneficial (Ramirez, Yuen, & Ramey, 1991). The second study, based on the records of 700,000 language minority students over a period of 7 years, also found that late-exit programs delivered the best results (Thomas & Collier, 2002).

Evaluations of bilingual education worldwide show that children educated through the medium of two languages consistently perform at least on a par with children educated only through the majority language, while they outperform their peers in the minority language (Edwards, 2004; Baker, 2006).

Community Efforts to Maintain Minority Languages

Bilingual education is, however, an option open to only a very small proportion of students. In most cases, the priority of the education system is to teach the official language; other languages are used mainly for transitional support. In reality, responsibility for maintaining minority languages lies mainly with minority language communities themselves. This is a continuation of a long-term trend: US Chinese-language schools, for instance, date back to the early 19th century (Edwards, 2004). For many years, new migrants needed to choose between assimilation to the English-speaking majority and maintaining heritage languages quietly at home. Various community groups—often based around religious institutions such as churches, mosques, gurdwaras, and temples—have assumed responsibility for teaching minority languages. In some cases, overseas governments took the lead; in other cases, classes were organized by informal groups of parents.

The increasing demographic and economic strength of migrant communities has sometimes made it possible to gain official support, as in the case of the provincial programs for heritage languages in Canada, or in the distribution of funding to the states and territories by Community Languages Australia (www.communitylanguagesaustralia.org.au). Community activism in these countries has tended to work in tandem with the globalization agenda. As pointed out by Commonwealth of Australia (2009):

Successive governments have reaffirmed a commitment to selecting high quality business migrants, in recognition of the benefits they contribute to Australia's increasingly global economy. They bring with them knowledge of overseas markets, business networks, cultural practices and often languages other than English, as well as their specific business skills and experience.

In the USA, modern foreign languages are now promoted in the interest of national security as well as global competitiveness. The National Security Language Initiative (www.ed.gov/teachers/how/academic/foreign-language/teaching-language.html) aims to increase the number of Americans mastering critical-need languages (such as Arabic, Chinese, Japanese, and Korean), starting at a younger age, as well as to increase the number of teachers and resources.

In the UK, social cohesion also figures prominently in official discourse concerning support for minority languages. As pointed out in the National Strategy for Languages in England (Department for Education and Skills [DfES], 2002, p. 12): "Drawing on the skills and expertise of those who speak community languages will promote citizenship and complement the Government's broader work on the promotion of social cohesion." Official support in recent years included the funding of the "Our languages" project (www.ourlanguages.org.uk) to promote teaching and learning through partnerships between mainstream and complementary schools; and greater flexibility in the accreditation of a wide range of languages through schemes such as Asset Languages (www.assetlanguages.org.uk) and the European Language Portfolio (www.coe.int/t/dg4/portfolio/). The UK position is thus in line with changing attitudes toward new minority languages in the European Commission which now actively promotes diversification in language learning, including non-European languages.

In all these settings, however, the main drivers of minority language provision remain local groups, assisted in varying degrees by umbrella organizations such as the Alliance

for the Advancement of Heritage Language in the USA (www.cal.org/heritage) the National Resource Centre for Supplementary Education in the UK (www.continyou.org.uk/what_we_do/children_and_young_people/supplementary_education), and Community Languages Australia.

Pedagogical approaches

Many of the early attempts to offer specialist programs for emergent bilinguals were based on a behaviorist model of learning: Children were required to master the correct form of words and the ways in which they are put together. Emphasis was placed on formal grammar and repetitive, rote drills with no attempt to relate the content of the teaching to the demands of the curriculum. In this approach, then, the content of learning is the language system itself.

The approaches to learning and teaching in mainstream classrooms today are, however, very different from those used in the days of “sink or swim.” The mainstreaming of emergent bilinguals acted as a stimulus for the development of theory with important implications for both pedagogy and curriculum.

As dissatisfaction with earlier provision grew, the focus shifted from decontextualized language learning to the learning of language through content (Mohan, 1986). In order to maximize learning, attention was paid to comprehensible input (Krashen, 1985), a notion that encompasses the strategies that support learning. Examples might include presenting students with background information that allows them to key into what is being taught, and the use of graphic organizers such as charts and tables. Inquiry-based activities involving discussion and the flexible use of small group work are also common. This approach is justified on the grounds that, in order to learn a language, we need to participate in its meaningful use.

Another development with implications for emergent bilinguals in mainstream classrooms is the distinction between *conversational* and *academic* fluency (Cummins, 2001). Conversational proficiency develops rapidly over a period of one to two years through face-to-face interaction where there is plenty of contextual support for understanding in the form, for instance, of non-verbal cues. Academic language proficiency, in contrast, is associated with academically demanding subject matter where, typically, there is a great deal less contextual support and acquisition is a much longer process—estimates vary from five to nine years. In classroom activities such as synthesis, analysis, and evaluation which demand higher-order thinking skills, the absence of contextual support is likely to place students operating in a second language at a disadvantage. In the past, children tended to receive additional help only until they developed conversational fluency. Increasing emphasis, however, is now being placed on the need to support the development of academic language proficiency over an extended period.

For much of the history of second language teaching, little attention was paid to the maintenance or development of the students’ first languages in the transition to mainstream schooling. Traditionally, second language teaching emphasized the exclusive use of instruction in the target language for transitional support and the avoidance of translation between first and second languages. More recent theories, in contrast, talk in terms of language *users* rather than language *learners* and focus on extending first language skills as part of a single, holistic, and more complex system of communication and meaning making (Cook, 2007). In this view, children should be judged by their success as second language users, not by their failure compared with native speakers. Strategies informed by this approach include encouraging students to write stories in their first language which they then talk about with other students in the second language; pairing students from the same language

background so that more fluent students can help less fluent peers; encouraging the use of bilingual dictionaries; and providing students with books in both their first and second languages.

The notion of “translanguaging” also offers interesting possibilities for reconceptualizing the realities of multilingual classrooms (García, 2009). In order to make meaning, students do not compartmentalize their languages; rather they make use of all their linguistic resources. Whereas code switching is often seen in negative terms as children’s failure to separate their languages, translanguaging normalizes attempts to use both languages as they develop competence in their weaker language.

Mainstream provision emphasizes the linguistic, cognitive, and metacognitive skills necessary for educational success. The aim is to systematically extend students’ grasp of academic language across the curriculum. Importance is attached to a fundamental principle of cognitive psychology, namely building new learning on a foundation of previous learning (Brandford, Brown, & Cocking, 2000). In linguistically diverse classrooms, this is achieved by drawing on the experiences which children bring with them to school, a process that both validates the identities of minority students and challenges narrowly ethnocentric curricula. In this approach, the whole school community, including parents, takes responsibility for developing responsive pedagogies and curricula (Cummins, 2001). There has thus been an important move away from the pathological model where responsibility for educational underachievement or non participation is placed solely on children and their parents.

Assessment

Multilingual classrooms present significant challenges for the assessment of learning. Given evidence that second language proficiency ceases to have a depressing effect on scores in reading and other school subjects only after four to five years of mainstream school experience (Katz, Low, Stack, & Tsang, 2004), the use of tools designed for first language speakers is extremely problematic not only on entry to school but also over a prolonged period of time. A variety of responses has emerged.

In the UK, a specialist teacher of English as an additional language usually undertakes initial assessment. If the teacher in question is unfamiliar with the language of the child, the school is encouraged to provide an interpreter who can talk to both the child and the parent. The emphasis is on what children can—rather than on what they cannot—do. It is further recommended that assessment of the second language should take place only when children have begun to communicate confidently in English. Official guidance stresses the importance of carrying out assessments in “a situation that is familiar to the learner” and ensuring that the children experience no “distress or discomfort” (Department of Children, Schools and Families [DCSF], *n.d.*).

Nationally or regionally developed scales or stages of language learning have been developed and incorporated into the curricula of Australia, Canada, the USA, and Ireland in order to counteract the weaknesses associated with assessment tools designed for first language speakers (Leung & Levkovicz, 2008). Examples include the ESL Scope and Scales, produced by the South Australian curriculum authorities, which link the content of the mainstream school curriculum and ESL descriptors. In the USA, the professional association of Teachers of English to Speakers of Other Languages has produced the K-12 ESL standards to provide teachers with broad requirements for second language development at different stages of schooling.

Other developments in the assessment of emergent bilinguals include modifications of the assessment tasks (e.g., introducing assessment in the first language, modifying

vocabulary, and the use of visual support) and changes to the assessment procedure (e.g., allowing extra time, giving instructions in the first language, and allowing the use of bilingual dictionaries).

More generally, there has been a move from summative assessment (the assessment *of* learning) to formative assessment (the assessment *for* learning). The first approach is intended “to certify learning and report to parents and students about students’ progress in school, usually by signaling students’ relative position compared to other students” (Earl, 2003). In assessment *for* learning, in contrast, teachers observe student responses to questions and tasks and give feedback to the students in order to promote the desired learning.

The increasing importance attached to testing in the USA in the wake of the No Child Left Behind Act has attracted bitter criticism for its attendant “unrealistic achievement targets, and punitive sanctions” (Crawford, 2008). Given the length of time required to achieve academic proficiency in English, the issues for students who arrive in the later years of schooling are particularly worrying. Interesting in this respect is the unplanned outcome of the imperative placed on schools to narrow the achievement gap between fluent and emergent bilinguals. For instance, to receive a regular high school diploma, students in New York State must pass five exams: Math A, Global History and Geography, US History and Government, any one science subject, and English. Students have the option of taking examinations in all these subjects (apart from English) in Spanish, Chinese, Korean, Russian, or Haitian Creole. This mode of assessment thus recognizes prior student learning and provides a more accurate picture of content knowledge.

Conclusion

The challenges for educators in an age of super-diversity are considerable. While learning the language of the new country is a matter of priority, there is less clarity as to how this is best achieved. We are, however, able to build upon a considerable body of experience.

We know, for instance, that conversational proficiency develops more rapidly than academic language proficiency and that emergent bilinguals are likely to continue to need support over a period which is often well in excess of four years after arrival. It is widely accepted that decontextualized language learning is far less effective than learning through content. And we understand that children are more likely to succeed when teachers attempt to build on prior experience, validating their identities in the process and challenging the assumptions of curricula which are all too often narrowly ethnocentric. Students’ first languages also need to be taken into account in the development of suitable assessment tools.

Similarly, we know that children educated bilingually perform at least on a par with children receiving a monolingual education, at the same time as outperforming their peers in the minority language. By the same token, the longer children receive instruction in their first languages, the better the educational outcome. New pedagogies, such as translanguaging, are emerging as a more creative pedagogical response to the realities of multilingual classrooms.

The climate is much more supportive of minority languages today than in the past, driven by interests as varied as the desire for global competitiveness, national defense, and the need for social cohesion. Yet minority language activists—increasingly in alliances within and across languages and attracting varying degrees of official support—continue to be the main providers of minority language education. One of the issues facing language groups in receipt of official support is, of course, the extent to which minority language speakers wish to retain their independence as to what they teach and how.

Bilingual Lexicography

PAUL BOGAARDS

Introduction

In many cultures bilingual lexicography is the oldest form of lexicography (but see Boisson, Kirtchuk, & Béjoint, 1991, for another point of view). This is understandable because the need to interpret texts in languages other than one's own is at least as old as the existence of writing. This situation underlines right away two characteristics of bilingual lexicography. The first, crucial, point is that in bilingual lexicography one of the two languages involved is always a language that is only partly known to the users of the dictionary. In most cases this is a foreign language, but sometimes it is a dialect that is not readily interpretable, and even the "translation" of an ancient form of a language into its modern shape presents fundamental characteristics of bilingual lexicography. The second feature is that bilingual lexicography is almost exclusively focused on written language. Before the first bilingual dictionaries came into being, in Europe in the 15th or 16th century, translations in the margins of texts or glossaries providing explanations of words used by an author had the same purpose as the receptive part of modern bilingual dictionaries: to make difficult vocabulary in texts understandable for speakers of another language. The need for a productive part, which is intended to make lexis available to those who want to express themselves in another language, was only recognized more recently.

This entry will first describe some of the structural aspects of bilingual lexicography, then move on to one of the major problems bilingual lexicography is confronted with: the equivalence between a word and its translation. Next, the various forms and the possible evolution of bilingual dictionaries will be explored. The concluding section will briefly examine bilingual dictionaries in the context of second language learning.

The Structure of Bilingual Entries

Let us begin by analyzing an example taken from an English–French dictionary:

hall /hɔ:l/ N **a** (= *large public room*) *salle f; [of castle, public building] [grande] salle f; (also village hall, church hall) salle f paroissiale; (Brit Univ) (= refectory) réfectoire m; → concert, music, town* **b** (= *mansion*) *château m, manoir m* **c** (*Theat*) **■ to play the ~s** *faire du music-hall* **d** (= *entrance way*) *[of house] entrée f; [of hotel] hall m* **e** (*US = corridor*) *couloir m* **f** (*Univ: also hall of residence (Brit), residence hall (US)*) *résidence f universitaire ■ to live or be in ~ habiter en résidence universitaire or en cité universitaire . . .* (Lefur, 2010, p. 1452)

It can be seen that information is there for native speakers of both English and French. Systematically, next to the entry word and the translations, all extra information that is meant for English users is given in italics. Speakers of English who want to translate the polysemous word *hall* into French will first of all have to choose the sense they need. The indications that distinguish the six senses (from a to f), e.g., "*large public room*" or "*Theat,*"

2 BILINGUAL LEXICOGRAPHY

are called “sense discriminators.” Sense discriminators are also used to mark differences in meaning that are not part of the English lexicon, but have to be taken into account in French, for instance for sense (d) “of house” or “of hotel.” All this information is necessary to guide the English speaker to the right translation. Once that has been ascertained, the reader is also given the gender of each of the French words, *f* (for feminine) or *m* (for masculine).

For French users, who are translating from the foreign language into their mother tongue, this information is superfluous. For such readers, the entry could have been much less complex and could have looked something like this:

hall /hɔ:l/ N **a** [grande] salle; salle paroissiale; réfectoire → **concert, music, town** **b**
château, manoir **c** (*Theat*) **■ to play the ~s** faire du music-hall **d** entrée; hall **e** couloir
f (*Univ*: also **hall of residence** (*Brit*), **residence hall** (*US*)) résidence universitaire . . .

In this simplified entry native speakers of French are sufficiently served because they are able in a given context to make the right choice between the translations given and, moreover, know whether a noun is feminine or masculine. The example given with sense (f) in the original entry does not give any extra information to French users because they will not have any difficulty in understanding this phrase.

This example entry leaves us, however, with a number of points that need some discussion. First, there is pronunciation. The entry word is presented with its transcription in International Phonetic Alphabet (IPA) characters. The question is: Who is going to profit from this information? Not the English user, who knows how to pronounce the word, nor the French reader who recognizes the form but does not necessarily need to pronounce it. On the other hand, the English speaker may have to pronounce the French translations, but these are given without any phonetic indications. These can normally be found in the French to English part of the dictionary, but would also be very useful at this point. Second, some of the sense discriminators, such as “*Univ*” or “*Theat*,” may serve both user groups although they are given in italics. This also applies to the language specifications, “*Brit*” and “*US*.” Finally, the references to “**concert, music, town**” are of interest to both types of users. Speakers of both English and French are reminded that the word looked up may be part of a compound that is translated elsewhere.

A dictionary like the *Robert & Collins*, from which the above example is taken, is called bidirectional because, in each entry, it tries to serve in both directions, from language A to language B and vice versa. It combines features of both *productive* and *receptive* bilingual dictionaries, which are also known under such names as *Hinübersetzungswörterbuch* and *Herübersetzungswörterbuch*, *Schreibwörterbuch* and *Lesewörterbuch*, *dictionnaire de thème* and *dictionnaire de version*, or *encoding* and *decoding dictionary*. These terms insist on the use of bilingual dictionaries in translation, reading, and writing. The terms *active* and *passive dictionary* that are sometimes used are less felicitous because it is difficult to see in what way either a dictionary or its use can be active or passive.

In order to better see what is necessary for the receptive or the productive user, it is useful to describe the formal structure of the entries that are part of either dictionary. First of all, it is important to stress which side contains the unknown (or lesser known) language. For the receptive dictionary, this is on the left side ($X > A$); for the productive dictionary, it is on the right side ($A > X$). As in mathematics, X represents the unknown. This is the *ignorance principle*, which says that nothing in language X is obvious for the native speaker of language A . It is also important to use the proper terms for the two languages: *foreign* or *X-language* and *mother tongue* or *A-language* are preferable to just *source* and *target language*.

In the productive dictionary, the user goes from the known to the unknown, or from a meaning to a form. A word [a] in the mother tongue can have several senses, and [a] has to be brought back to the intended meaning or "lexical unit" (see Cruse, 1986) by a sense discriminator. This unique lexical unit [a¹] can then be translated. The form that is provided in the foreign language [x] should be accompanied by two types of parameters: grammatical and discursal. The grammatical data should be as complete as possible, covering all syntactic, morphological, and phonological information that is necessary for the foreign learner to use the item correctly. The discursal information should specify the exact semantic value of [x] and make clear any difference in style or connotative value between [a¹] and [x] so as to enable its appropriate use. This type of information should also include indications about collocations. If more than one translation is given for [a¹], the translations have to be accompanied by their own grammatical and discursal information. The basic formula for the productive dictionary is thus:

$$a-[a^1] \Rightarrow x \langle g, d \rangle (y \langle g, d \rangle, \dots)$$

It will be clear that, in the entry above, the French translations of sense (b), *château* and *manoir*, which are far from synonymous, have not been sufficiently distinguished for the English-speaking user on the level of discourse, and the grammatical information provided is minimal.

The basic formula for the receptive dictionary is:

$$x /t/ \Rightarrow a \text{ (comment).}$$

In other words, the foreign form *x* should be accompanied by all traits /*t*/ that are necessary to permit its unique identification. The features used may be of a grammatical or a discursal nature but can be less exhaustive than on the right side in the productive dictionary. They cannot be of a purely semantic type, however, because users are supposed not to know the meaning of this form. What users can know is the part of speech of *x*, as well as the kind of text they are reading (architecture or medicine; literary or slang; British or American; etc.). Using the traits, foreign readers should be able to recognize that the form they find in the dictionary exactly corresponds to the one they came across in their reading. The translation provided should be self-evident for the mother-tongue speaker. As many words are polysemous, however, many translations in the receptive dictionary should be accompanied by some extra information ("comment" in the formula). One of the ways of doing this is to provide a number of synonymous translations. Whenever this is possible, this can have the additional advantages of giving a better idea of the total semantic space covered by the foreign item and of suggesting a number of alternative possibilities to the translator. If no synonyms are available, then some other form of commentary should be provided so as to make sure that the user will have a correct representation of the meaning of the foreign item. In the example above, a single translation of the first sense of "**hall**" as "*salle*" would leave the French user puzzled about the type of room that was meant.

As will be clear, bilingual dictionaries do not always live up to these general rules. In printed dictionaries it is physically impossible to give all details about the use of the foreign forms that are found as translations in the productive part. In bidirectional dictionaries especially, it is often very hard to specify them in a satisfactory way: giving a number of translations in the receptive dictionary is useful and in many cases even necessary, whereas this leads to quite complicated results in the productive dictionary, where each of these translations has to be accompanied by grammatical and discursal information. It has been

proposed, therefore, that the two types of dictionaries be separated and that there should be not two, but four (Shcherba, 1995; see also Bogaards, 1990) or even more (Kromann, Riiber, & Rosbach, 1990) dictionaries per language pair.

Translation and Equivalence

Bilingual dictionaries are often called translation dictionaries, and translation is indeed the heart of this type of reference work. It is a very special type of translation, however, focusing on isolated words rather than a text. It is well known that many words have different senses according to the context in which they are used, and translators are often forced to compensate in other ways for a lack of total correspondence between the original word and its translation. This is not possible in a bilingual dictionary, where the user wants to find the exact equivalent of the entry word. For a number of reasons, exact equivalence is often not easily attained.

Good equivalence exists between such lexical units as English *blanket* and French *couverture*, as is the case with other nouns for concrete objects as well as with more technical terminology. At the other end of the spectrum, we find concepts that do not have any equivalent in the other language. Duval (1991, p. 2818) gives the example of the French *ballotage*, which can only be translated as something like “situation in a political election when no candidate has an absolute majority in the first ballot and people have to vote again.” Such culturally bound items do exist in various domains, such as national holidays, political systems, special dishes, or items of clothing. In between these two extremes are many cases of what is called *anisomorphism*—the phenomenon that languages categorize “reality” in different ways (see Zgusta, 1971; Yong & Peng, 2007). A case in point is *hall* in the sense of a large country house or mansion: the name for a category of buildings is quite clear to speakers of British English, but that does not correspond to any existing category of buildings in French. This means the two French translations given in the example above, *château* and *manoir*, taken together, cover more or less the same ground as *hall* in this particular sense, but they are not real equivalents.

Another typical example of anisomorphism is the Hungarian words for *brother*: *báty* and *öcs*, the first one referring to an older brother and the latter to a younger brother—no single word exists for the whole category of “brother.” The phenomenon of a single term in the mother tongue that corresponds to two distinct terms in the foreign language is called *divergence*; in the other direction, when two distinct terms in the mother tongue correspond to one term in the foreign language, the feature is called *convergence*. Ideally, equivalents should have not only the same denotative meaning but also the same connotations, the same style level, as well as a comparable frequency in the two languages. If the French word *étrille* is translated as *swimming crab* (see Duval, 1991, p. 2819), only the denotative meaning is equivalent; the frequency is quite different as is the reference to something one can eat. The translation of the English *Saturday* into German shows another case of maintenance of the denotative meaning; regional variants here have to be distinguished, however, as this day is called *Samstag* in most of the German-speaking world but *Sonnabend* in the northern part of Germany. Although the Dutch *heengaan* and the French *partir* both mean ‘to leave a place’, the French word is not a perfect equivalent of the Dutch verb because the Dutch form is only used in a formal, written style, whereas the French verb is more neutral. It will be clear that all these cases of partial equivalence will have different implications for the productive and the receptive user of the dictionary, and therefore require different treatments.

If full equivalence is hard to provide for isolated words, this becomes even more difficult for other lexical units that have to be translated in the bilingual dictionary. Fixed expressions only seldom have perfect equivalents in other languages. A French expression like

ça vaut son pesant d'or or *ça vaut son pesant de cacahuètes* (lit. 'that is worth its weight in gold' or 'in peanuts') is not ill translated as *it's priceless*, but this translation lacks the flavor of the French original. And someone who is completely dead is *as dead as a doornail* in English, *zo dood als een pier* (lit. 'as dead as a worm') in Dutch, *mausetot* (lit. 'mouse dead') in German, and *raide mort* (lit. 'stiff dead') in French. Although these are all good equivalents, the images they evoke are quite different. The same goes for proverbs and other sayings that are part of the language and should therefore be included in a good bilingual dictionary.

Types of Bilingual Dictionaries

Bilingual dictionaries come in various sizes. Some are very compact, containing only the most frequent words of the two languages. Often these are meant to be used by younger students and they tend to propose a kind of bilingual list without any additional information. As the ignorance principle is not taken into account, they turn out to be very difficult to actually use, especially when they are meant to be bidirectional.

A special type of bilingual lexicography is constituted by the so-called *bilingualized* or *semi-bilingual* dictionaries. Dictionaries of this type are based on a monolingual one, containing definitions and other explanations in one language but, in addition, they provide translations in another language. These translations may be limited to equivalents of the entry words or may include translations of examples or other elements (for an overview, see Kernerman, 1996; Marelllo, 1998; Lew, 2004). Like the monolingual (learner's) dictionaries they are based on, bilingualized dictionaries are essentially readers' dictionaries. In the productive part, they may contain a kind of index giving references from the mother tongue to foreign-language entries in the dictionary itself, but such indexes are often very poor bilingual lists without any sense discrimination and without any special care taken to guide users in handling any special contrastive difficulties they may be confronted with in the other language (see Bogaards & Hannay, 2004).

Recently, some proposals have been put forward to combine monolingual and bilingual elements in one dictionary, especially for productive purposes. Expanding on an earlier sketch by Laufer (1995), Laufer and Levitzky-Aviad (2006) describe a dictionary in which L1-to-L2 translations are enriched by information about the L2 translation options and by L2 words that are semantically related so that the user can select the most suitable word out of several words in the semantic area. In a similar vein Bogaards and Hannay (2004) argue that the rich information that can be found in English learners' dictionaries should be made available in a bilingual setting. The user should thus be provided not just with a form in the foreign language, as is the case in traditional bilingual dictionaries, be they in paper or in electronic form, but with fully fledged lexical units with all necessary semantic information, a rich grammatical description, collocational possibilities, references to alternative meanings (synonyms, hyponyms, antonyms, and so on), as well as warnings against pitfalls and specific contrastive difficulties. A dictionary of this type, which can only be realized in electronic form, will constitute a real step forward in the development of bilingual lexicography.

Bilingual Lexicography and L2 Learning

Over the last years it has become ever more evident that, in L2 learning, the native language of the learner plays an important role. Not only in the first phase of the learning process but even in proficient bilinguals, "lexical and semantic information in L1 is activated during both comprehension and production in L2" (Kroll & Sunderman, 2003, p. 122). Laufer and Girsai (2008, p. 712) rightly conclude that "meaningful communication

has been the goal of communicative language teaching, but the best method for achieving this goal may not be identical to the goal itself.” Excluding the native language of the learner, as is done in monolingual learners’ dictionaries, therefore does not necessarily seem to be the most effective way of presenting the lexicon of the foreign language.

For a long time, L2 learning was almost exclusively seen as the domain of grammar. Nowadays, the importance of lexis is more and more recognized (see Gass & Selinker, 2008, p. 449). At the same time, the link between L2 learning and lexicography was dominated by the presence of monolingual learners’ dictionaries (see Bogaards, 2010). There is now room for a new look at the whole process of L2 acquisition and the role bilingual lexicography can play in it.

Bilingual Literacy

NANCY H. HORNBERGER

Bilingual literacy, or biliteracy, can be defined as “any and all instances in which communication occurs in two (or more) languages in or around writing” (Hornberger, 1990, p. 213), where these instances may be events, actors, interactions, practices, activities, classrooms, programs, situations, societies, sites, or worlds (Hornberger, 2003). The continua model of biliteracy offers a framework in which to situate research, teaching, and language planning in bilingual and multilingual settings. The model’s intersecting and nested continua demonstrate multiple, complex, and fluid interrelationships between bilingualism and literacy and the contexts, media, and content through which biliteracy develops. From the framework, we argue that for multilingual learners, the *development* of biliteracy occurs

along intersecting first language–second language, receptive–productive, and oral–written language skills continua; through the *medium* of two (or more) languages and literacies whose linguistic structures vary from similar to dissimilar, whose scripts range from convergent to divergent, and to which the developing biliterate individual’s exposure varies from simultaneous to successive; in *contexts* that encompass micro to macro levels and are characterized by varying mixes along the monolingual–bilingual and oral–literate continua; and . . . with *content* that ranges from majority to minority perspectives and experiences, literary to vernacular styles and genres, and decontextualized to contextualized language texts. (Hornberger & Skilton-Sylvester, 2000, reprinted in Hornberger, 2003, p. 35; see also Hornberger, 1989)

Further, we suggest there is a need to contest traditional top-down power weightings in education toward compartmentalized, monolingual, written, decontextualized language and literacy practices, by intentionally opening up implementational and ideological spaces for fluid, multilingual, oral, contextualized practices and voices at the local level (Hornberger, 2003, 2005, 2006; Hornberger & Johnson, 2007). The model has been exhaustively described and exemplified elsewhere (e.g., Hornberger 1989, 1990, 2003, 2008, 2010); this entry will briefly review its origins and then take up each of the four sets of continua—contexts, development, content, and media—in relation to recent and enduring assumptions and perspectives in research in anthropological linguistics and sociolinguistics, literacy studies, and bilingualism and multilingualism.

The original impetus for the continua model of biliteracy was an ethnographic research project I initiated in two multilingual communities of Philadelphia in 1987, the Literacy in Two Languages project, which continued for about a decade with participation also from my students and colleagues. In search of a framework to underpin that research and finding very little scholarly work attending explicitly to biliteracy, I looked instead to its component parts—work on bilingualism and the teaching of second or foreign languages and on literacy and the teaching of reading and writing. An enduring perspective that emerges in common across these literatures is that, although scholars, practitioners, and policy makers often characterize dimensions of bilingualism and literacy in terms of polar opposites such as first versus second languages (L1 vs. L2), monolingual versus bilingual individuals, or oral versus literate societies, in each case those opposites represent only

theoretical endpoints on what is in reality a continuum of features. Further, when we consider biliteracy as the conjunction of literacy and bilingualism, it becomes clear that these continua are interrelated dimensions of highly complex and fluid systems; and that it is in the dynamic, rapidly changing and sometimes contested spaces along and across the intersecting continua that most biliteracy use and learning occur.

These insights became the basis for the continua of biliteracy model proposed in 1989 and since developed in my own and others' research in Philadelphia, nationally and internationally (Hornberger, 1990, 2003, 2008, 2010; Hult & King, 2011). Along the way, the framework has evolved and adapted to accommodate both a changing world and a changing scholarly terrain. Recent scholarship in the field of bilingualism on languaging, translanguaging, and flexible bilingual pedagogy, and in anthropological linguistics, sociolinguistics, and literacy studies on mobility, communicative repertoire, and transnational literacies highlight threads woven into the continua, as I explore in the sections which follow.

Mobility and Sociolinguistic Scales: Contexts of Biliteracy

The continua model of biliteracy posits that contexts influence biliteracy development and use at every level from two-person interaction (micro) to societal and global relations of power (macro) and that they comprise a mix of oral-to-literate, monolingual-to-multilingual varieties of language and literacy (Hornberger, 1989). Recognition of context as an important factor in language use dates back at least to the 1960s and the beginnings of sociolinguistics, linguistic anthropology, and the ethnography of communication; and continues up to the present in work on sociolinguistic scales, indexicality, and polycentricity (Blommaert, 2010).

Sociolinguistics broke new ground in the 1960s by moving the analysis of language beyond a focus on structure to one on language use in social context. Rather than study homogeneous languages, sociolinguists (particularly those in the linguistic anthropological tradition) took up the study of speech communities and their verbal repertoires, described in terms of speech (or, more broadly, communicative) domains, situations, events, and acts. Hymes (1964, pp. 3, 13) proposed that:

[The ethnography of communication] must take as context a community, investigating its communicative habits as a whole, so that any given use of channel and code takes its place as but part of the resources upon which the members of the community draw . . . The starting point is the ethnographic analysis of the communicative habits of a community in their totality, determining what count as communicative events, and as their components . . . The communicative event thus is central.

Gumperz, co-founder with Hymes of the ethnography of communication, built on work by Goffman on face-to-face interaction, emphasizing

a view of language as a socially and culturally constructed symbol system that is used in ways that reflect macrolevel social meanings (e.g. group identity, status differences) but also create microlevel social meanings (i.e., what one is saying and doing at a particular moment in time). (Schiffrin, 1996, p. 315)

His work investigates how contextualization cues, that is "signalling mechanisms such as intonation, speech rhythm, and choice among lexical, phonetic, and syntactic options" (Gumperz, 1982, p. 16), relate what is said to participants' background knowledge, enabling them to make situated inferences about their interlocutors' meaning.

More recently, Blommaert (2010) proposes and charts a further paradigmatic shift from a sociolinguistics of variation to a sociolinguistics of mobility. In keeping with an increasingly globalized world, he suggests, we need “a sociolinguistics of mobile resources, framed in terms of trans-contextual networks, flows, and movements” (2010, p. 1). Building on and citing a rich literature in linguistic anthropology and sociolinguistics over the past several decades, he offers three conceptual tools to help us think about language in this new sociolinguistics: sociolinguistic scales, orders of indexicality, and polycentricity—all sharing an emphasis on power and spatiotemporal sensitivity. Sociolinguistic scales are layered spatiotemporal scales at micro (e.g., local), macro (e.g., global), and intermediary (e.g., state) levels, distributed not only across horizontal space but also along vertical (hierarchical) dimensions (Blommaert, 2010, p. 34). Indexicality refers to the jump from one scale to another—for instance Gumperz’s contextualization (1982) or Goffman’s frames (1974)—and is ordered both “as ‘types’ of semiotic practice with predictable (presupposable/entailing) directions” (i.e., indexical order; Blommaert, 2010, p. 37, citing Silverstein, 2003) and as a “stratified general repertoire in which particular indexical orders relate to others in relations of mutual valuation—higher/lower, better/worse” (i.e., orders of indexicality; Blommaert, 2010, p. 38). Polycentricity refers to the multiple centers of authority to which people orient in communication, whether these reside in an individual, a collective, an abstract entity or ideal, and so on. Every environment of human communication is almost by definition polycentric and, like indexicality, polycentricity explicitly signals structures of power and inequality (Blommaert, 2010, pp. 39–41).

Contexts of biliteracy, then, can be understood as scaled spatiotemporal complexes, indexically ordered and polycentric, in which multilingualism and literacies develop within mobile multilingual repertoires in local spaces which are simultaneously translocal and global. In this light, the call for opening up implementational and ideological spaces for fluid, multilingual, oral, contextualized practices and voices in educational policy and practice becomes an even more powerful imperative for contesting the social inequalities of language.

Languaging and Communicative Repertoires: Media of Biliteracy

Biliteracy is about communication in two (or more) languages in or around writing; crucial in this are the languages and scripts—the media—through which biliteracy is learned and used. Media in the continua of biliteracy model refer to the actual communicative repertoires, that is the language varieties and scripts through which multilingual literacies are expressed, and the sequences or configurations in which they are acquired and used. The model defines these in terms of the linguistic structures of the languages involved (on a continuum from similar to dissimilar), their orthographic scripts (from convergent to divergent), and the sequence of exposure to or acquisition of the languages or literacies (ranging from simultaneous to successive; Hornberger, 1989). The media component in the continua model is roughly equivalent to Hymes’s Instrumentalities in the SPEAKING heuristic (Hymes, 1974), including both code and channel, where “code” refers to language varieties, dialects, styles, while “channel” includes written, as well as oral, telegraphic, and other communicative modes.

From the earliest formulations of the ethnography of communication on down to the present, linguistic anthropological research in sociolinguistics has emphasized a focus not on languages per se but on verbal or communicative repertoire. Gumperz (1964) introduced the term “verbal repertoire” in seeking to describe multilingualism in India. Hymes referred to a child’s verbal repertoire as “the range of varieties of language, the circumstances, purposes, and meanings of their use” (Hymes, 1980, p. 106). More recently, Blommaert

writes of repertoires as the complexes of linguistic, communicative, semiotic “resources people actually possess and deploy,” such as “concrete accents, language varieties, registers, genres, modalities such as writing—ways of using language in particular communicative settings and spheres of life, including the ideas people have about such ways of using, their language ideologies” (2010, p. 102). Similarly García (in Makoni & Pennycook, 2007; García, 2009), in recognition of the mobility and fluidity of linguistic resources, the dis-inventing and reconstituting of languages (Makoni & Pennycook, 2007), calls for a focus not on language *per se* but on “the multiple discursive practices that constitute . . . languaging” (García, 2009, p. 40), wherein languages are seen not as fixed codes, but as “fluid codes framed within social practices” (García, 2009, p. 32).

Assumptions within the continua model about diversity of language varieties and scripts, and multiple paths and varying degrees of expertise in the learning and use of communicative repertoire, are consistent not only with theoretical stances of the ethnography of communication and the sociolinguistics of mobility, but also with work on multimodal expression and multiliteracies, extending literacy beyond reading and writing to other domains such as the visual, audio, spatial, and behavioral (Cazden et al., 1996). Consideration of the media of biliteracy entails attention not just to different languages, dialects, styles, and discourses, then, but also to different communicative modes including technological ones, as they are acquired and used—not in a dichotomized sequence but more often in crisscrossed, hybrid mixes and languaging practices.

This is not to suggest that incorporating multiple varieties, scripts, communicative modes, and crisscrossed paths of acquisition and use proceeds unproblematically in schools or other biliteracy learning contexts. Indeed, given that biliteracy implies the scaled, polycentric, and indexical intersection of biliterate learners’ multiple literacy worlds in particular literacy sites (see Hornberger in Martin-Jones & Jones, 2000, p. 362), some implicit conflict in norms, practices, and identities is inevitable. It is precisely in these sites of conflict that relationships among differing language and literacy practices are most evident (in the same way that sociolinguistic norms of interaction are most salient when they are breached; see Hymes, 1968, p. 123). This in turn brings languaging to the fore in educational contexts, as evidenced by children’s mixing, blending, and recasting literacy practices from home and school to unique new patterns and forms (see, e.g., Gregory & Williams in Martin-Jones & Jones, 2000, p. 52), or by teachers’ and students’ acceptance and encouragement of multiple languages and registers, unauthorized side-talk, movement, spontaneous interaction, and collaboration (e.g., Gutiérrez, Baquedano-López, & Tejeda, 1999).

Translanguaging and Flexible Bilingual Pedagogy: Development of Biliteracy

The continua model posits that the development of biliteracy may start at any point on any of three intersecting continua of first language to second language (L1–L2), oral to written, and receptive to productive language and literacy skills, uses, and practices; that biliteracy learning may proceed in any direction along those intersecting continua; and that it may do so by backtracking, spurting, or crisscrossing just as readily as by steadily progressing in linear fashion. There is an infinite potential for transfer of skills across any of the three continua of biliteracy development, but, by the same token, understanding or predicting transfer is elusive precisely because the three development continua are interrelated and furthermore nested within all the other continua (Hornberger, 1989).

Research in bilingualism has consistently suggested an integrated, holistic, context-sensitive view of bilingual development, a view wherein the bilingual is much more than the sum of two monolinguals. Cummins’s (1979) groundbreaking proposal of the

developmental interdependence and thresholds hypotheses laid the theoretical ground for what remains a central tenet in scholarship on bilingualism (if not, sadly, in educational practice), namely, “that a child’s first language skills must become well developed to ensure that their academic and linguistic performance in the second language is maximized” (Baker & Hornberger, 2001, p. 18). Close on the heels of this work, bilingualism scholars like Zentella (1981), Valdés (1982), and Grosjean (1985) provided empirical evidence for bilinguals’ fluid code switching as a highly context-sensitive, competent but specific language practice. Decades of research continue to corroborate, deepen, and extend this understanding. Just as Grosjean (1985) suggested that a bilingual is not the sum of two monolinguals any more than a hurdler is simply the sum of a sprinter and a high jumper, García (2009), in her recent tour de force on bilingual education in the 21st century, argues that bilingualism is “not monolingualism times two” (2009, p. 71), “not like a bicycle with two balanced wheels,” but “more like an all-terrain vehicle,” whose wheels “extend and contract, flex and stretch, making possible, over highly uneven ground, movement forward that is bumpy and irregular but also sustained and effective” (2009, p. 45). García captures this view of bilingualism with the term “translanguaging,” referring to the “multiple discursive practices in which bilinguals engage in order to make sense of their bilingual worlds” (2009, p. 45).

García borrows and extends the term translanguaging, originally “*trawysieithu*” in Welsh as proposed in a Welsh-medium thesis and taken up by Baker (in Hornberger, 2003) as translanguaging and transliteracy in reference to pedagogical practices where students hear or read a lesson, a passage in a book, or a section of work in one language and develop their work in another (e.g., by discussion, writing a passage, completing a work sheet, conducting an experiment); input and output are deliberately in a different language and are systematically varied (Baker in Hornberger, 2003, p. 82). Baker argues that the continua of biliteracy anticipate and extend the notion of translanguaging and transliteracy, providing a reminder of tensions that will typically be present and of the need to tip the balance toward the minority language to adjust for greater prestige associated with the majority language, as well as of the strategic need “to consider all the dimensions of the continua to create full biliteracy in students” (Baker in Hornberger, 2003, p. 84). Translanguaging practices have the potential to explicitly valorize all points along the continua of biliterate context, media, content, and development. Such practices, recently and eloquently theorized and documented also as hybrid classroom discourse practices (Gutiérrez et al., 1999), multilingual classroom ecologies (Creese & Martin, 2003), a four-quadrant pedagogic framework for developing academic excellence in a bilingual BA degree program (Joseph & Ramani, 2004; Hornberger, 2010), bilingual supportive scaffolding (Saxena, 2010), and flexible bilingual pedagogy (Blackledge & Creese, 2010), offer the possibility for teachers and learners to access academic content through the linguistic resources and communicative repertoires they bring to the classroom while simultaneously acquiring new ones.

Blackledge and Creese (2010) document flexible bilingual, translanguaging pedagogies uncovered through ethnographic team research in UK complementary schools—four interlocking case studies in four cities focusing on complementary schools in Gujarati, Turkish, Bengali, and Chinese heritage communities. They offer an ethnographic illustration of specific translanguaging knowledge and skills such as use of bilingual label quests, repetition, and translation across languages; of students’ use of translanguaging to establish identity positions both oppositional to and encompassing of institutional values; and of teachers’ endorsement of simultaneous literacies and languages to keep pedagogic tasks moving. They argue for a release from monolingual instructional approaches and easing of the burden of guilt associated with translanguaging in multilingual educational contexts. They demonstrate the potential of schools as alternative, safe spaces for multilingualism, sites where young people creatively use varieties of language including standard, regional,

class, and youth-oriented varieties as well as parodic language to take up, resist, and negotiate multiple academic and identity positionings.

Transnational Literacy Practices and Identities: Content of Biliteracy

The continua model posits that *what* (content) biliterate learners and users read and write is as important as *how* (development), *where and when* (context), or *by what means* (media) they do so. Whereas schooling traditionally privileges majority, literary, and decontextualized contents, the continua model argues for greater curricular attention to minority, vernacular, and contextualized whole-language texts. Minority texts include those by minority authors, written from minority perspectives; vernacular ways of reading and writing include notes, poems, plays, and stories written at home or in other everyday non-school contexts; contextualized whole-language texts are those read and written in the context of biliteracy events, interactions, practices, and activities of biliterate learners' everyday lives (Hornberger & Skilton-Sylvester in Hornberger, 2003). Note that the term "minority" here connotes not numerical size, but "observable differences among language varieties in relation to power, status, and entitlement" (May, 2003, p. 118). In today's usage, we might more likely use the term minoritized to "[convey] the power relations and processes by which certain groups are socially, economically, and politically marginalized within the larger society. This term also connotes human agency to effect change" (McCarty, 2005, p. 48).

Assumptions within the continua model about the importance of incorporating minoritized identities and perspectives, vernacular genres and styles, and contextualized texts in biliteracy learning contexts parallel other developments in research on bilingualism and multilingualism including the funds of knowledge project and work on multilingual and transnational literacies. Moll and colleagues argue that "community funds of knowledge" (sometimes called household funds of knowledge or local funds of knowledge), defined as "historically accumulated and culturally developed bodies of knowledge and skills essential for household or individual functioning and well-being" (Moll & González, 1994, p. 443), are a resource which can and should be drawn on in schooling for language-minority populations. The centerpiece of their work is collaboration with teachers in conducting household research; together they have found that, when teachers mediate by developing curricula that reflect content from both the standard curriculum and students' languages, cultures, and lives, students are empowered in their learning.

Research in multilingual literacies also takes the view that multiple languages and literacies, and the cultural practices and views of the world in which they are embedded, are resources on which individuals and groups may draw as they "take on different identities in different domains of their lives" (Martin-Jones & Jones, 2000, p. 1). Authors in Martin-Jones and Jones's (2000) volume provide richly detailed accounts and analyses of, for example, a minority-group member who, as an act of resistance, refuses to become literate because acquisition of majority-culture literacy requires the adoption of some of the cultural behaviors and values of the majority group; or how the interactions between a young Welsh farmer and a delegate of the Ministry of Agriculture, Fisheries and Food (as they fill out an Animal Movement form) reflect a hybrid combination of elements of bureaucratic and farm-world discourses in Welsh and English. This work, in parallel with the continua of biliteracy framework, focuses attention on the multiple ways people draw on and combine the codes in their communicative repertoires to make meaning as they negotiate and display cultural identities and social relationships.

Similarly, authors in Warriner (2007) take up multilingual and multimodal literacies and the identities and social relations maintained and transformed through those literacies.

Here, the focus is on transnational youth and adults, transmigrants who have moved bodily across national borders while maintaining and cultivating practices tied—in varying degrees—to their home countries. Drawing on long-term, in-depth ethnographies, the authors demonstrate how these youth and adults' transnational literacy practices and identities are profoundly rooted in processes of globalization, and constantly shift and develop across time and space. Dominican student María succeeds in positioning herself and being positioned over time as a “good” student at Luperón bilingual high school in New York, by drawing on resources provided by the school's local model of success, including high status for Spanish language and literacy, and the valuation of task-based literacy practices (Bartlett in Warriner, 2007); three young Latinas draw on transnational funds of knowledge and social relations in developing their retelling of the “return to Mexico” narrative, a counterstory to deficit portrayals of Mexican immigrant families (Sánchez in Warriner, 2007); newcomer Mexican students' informal literacy practices of tagging, branding, and shouting out at Captainville High are shown to be “literacies of display” of their transnational identities (Richardson Bruna in Warriner, 2007); three youths engage in online multilingual, multimodal creative exploration and negotiation of complex multiple identities across race, ethnic, gender, socioeconomic, and nationalist lines (McGinnis et al. in Warriner, 2007); and women refugee ESL learners struggle to negotiate successful new work identities for themselves, in spite of, rather than because of, an ESL pedagogy that prioritizes reading, copying, responding to known-answer questions, filling in the blanks, and memorizing at the expense of drawing on the first language literacies and multilingual competencies they brought with them (Warriner, 2007).

These cases illuminate the identities constructed and negotiated (biliteracy content), transnational spaces (biliteracy contexts), multimodal literacy practices (biliteracy media), and trajectories across time and space (biliteracy development) that the transmigrants take up. These instances, and others I have mentioned in the preceding sections, broaden and deepen the continua of biliteracy in ways that could not have been foreseen 20 years ago—neither in the real world nor in the research world. I am struck simultaneously by how different and how much the same our world—and our ways of describing our world—are today, as compared to 25 years ago when I started to research these issues. Globalization and mobility, multimodality and languaging, transnationalism and translanguaging were much less visible then, and the conceptual tools with which to study them much less developed, and yet the underlying realities of complexly multilingual contexts, richly diverse repertoires of communicative media, socially constructed meanings in textual content, and multiple potential trajectories of multilingual language and literacy development remain as enduringly and endearingly human now as then. Equally, or more so, multilingual learners deserve our continual reimagining and opening up of educational spaces that foster their ongoing development and creative transformation of their mobile—and biliterate—lives and literacies.

Bilingual/Immersion Teacher Education

DIANE J. TEDICK AND TARA W. FORTUNE

Bilingual education is a broad term that encompasses a wide range of program models involving use of at least two languages for academic instruction, one being the majority language of the geographic area where the program is offered. Fortune and Tedick (2008), among others, identify four bilingual/immersion models as a subset within this broad category that have distinct design features and end goals: one-way foreign language immersion, two-way bilingual immersion, one-way developmental bilingual education, and indigenous language immersion. These school-based programs offer a minimum of 50% of subject-matter instruction through a second, foreign, heritage, or indigenous language. They aim for *additive bi- or multilingualism* and *additive bi- or multiliteracy* (i.e., the addition of one or more languages while further developing the first), academic achievement, and intercultural understanding. Baker (2006) refers to these four models as “strong” forms of bilingual education. This entry is limited to teacher education for these models.

Bilingual/immersion teacher education is a unique and evolving area in the larger field of language teacher education. Scholars have argued that in addition to native or near-native proficiency in instructional language(s), bilingual/immersion teaching requires a particular knowledge base and skill set (Snow, 1990; Young, 1995; Day & Shapson, 1996; Evans, Hoare, Kong, O'Hallaron, & Walker, 2001; Freeman, Freeman, & Mercuri, 2005; Lyster, 2007; Fortune, Tedick, & Walker, 2008). It is far more than simply teaching language or teaching content. Despite widespread agreement that bilingual/immersion pedagogy is different, until recently there has been a surprising lack of clarity and consistency regarding what it takes to be an effective teacher in such settings. This is likely due in part to at least three common misperceptions about bilingual/immersion education: (1) being a proficient user of a language makes one a skilled bilingual/immersion teacher; (2) bilingual/immersion teaching is, at its core, simply “good teaching”; and (3) for students, learning through a second language is very similar to learning through the first. Thus, bilingual/immersion teacher preparation in general remains underdeveloped.

There are very few preservice programs that prepare bilingual/immersion teachers. In part this results from lack of licensure requirements. Internationally, bilingual/immersion teacher credentials typically parallel those for pre-K-12 classrooms. The only other common requirement is native to near-native proficiency in the instructional language(s). In contexts where there exist a sufficient number of same-language bilingual/immersion programs, teacher educators may deliver some or all of the coursework through the language(s) in which prospective teachers will offer instruction.

Some programs have been designed to prepare one-way foreign language immersion teachers. Canada has approximately 14 such programs (Karsenti & Dumouchel, 2006), many embedded within comprehensive “French as a second language” preparation programs. Finland and Australia have also developed immersion-specific teacher education programs. Launched in 1993, Australia's Language and Culture Initial Teacher Education Program (LACITEP) offered part of the curriculum in Japanese to provide English-speaking student teachers an opportunity to acquire immersion-specific teaching skills and knowledge while furthering their Japanese proficiency (Erben, 2005). The final LACITEP cohort at Central Queensland University graduated in 2006 (T. Erben, personal communication, April 5,

2011). Finland's Swedish immersion teacher education program began in 1998 as a joint effort between universities in Vaasa and Oulu but was discontinued in 2009 (K. Mård-Miettinen, personal communication, February 10, 2011). The demise of these offerings reflects the challenge of sustaining such "niche" programs economically, particularly when licensing requirements are lacking and demand is relatively low.

In a few cases, instead of designing comprehensive bilingual/immersion teacher education programs, tertiary-level institutions have required individual courses focused on immersion teaching strategies or courses dedicated to teaching a particular language, such as Welsh or Irish, as a first or second language (W. G. Lewis, personal communication, March 7, 2011; P. Ó Duibhir, personal communication, February 9, 2011). These courses are taken in addition to a general teacher licensure curriculum.

There are also preservice programs designed to prepare bilingual/immersion teachers for the two contexts that serve language minority learners: developmental bilingual and two-way programs. Most of these bilingual teacher licensure and endorsement programs emerged during the 1970s and 1980s primarily in the USA (Commission on Teacher Credentialing, 2010) and focused on preparing teachers for various bilingual education programs. With funding from the US Department of Education and strong interest from prospective teachers, states with large numbers of language minority children developed a coherent set of courses that addressed second language acquisition; bilingual methods, materials, and assessment; cross-cultural education; biliteracy; and so forth. A growing number of these programs have expanded their focus to address the preservice needs of two-way bilingual immersion teachers specifically.

Indigenous immersion teacher preparation programs are unique in that nearly all participants are learners of the indigenous language and culture. This has led to programs in which the indigenous language and culture are foundational to the curriculum. For example, the Kahuawaiola Indigenous Teacher Education Program in Hawai'i offers post-baccalaureate Hawaiian immersion teacher certification through the medium of Hawaiian (Wilson & Kawai'ae'a, 2007) and engages participants in lived experiences within the Hawaiian worldview. New Zealand also offers preservice programs to prepare Māori immersion teachers for early childhood and primary levels (K. Edmonds, personal communication, April 6, 2011).

Given the small numbers of formal bilingual/immersion teacher preparation programs internationally, most teachers are not prepared explicitly for the bilingual/immersion context and instead learn "on the job" and through in-service professional development. The increase in bilingual/immersion programs and the specialized needs of these educators have prompted continuing professional development programs to materialize worldwide in areas such as Canada (Day & Shapson, 1996), Hong Kong (Hoare & Kong, 2001), Finland (Björklund, 1997), New Zealand (Hindle, 2002), and a growing number of US states where there is a critical mass of bilingual/immersion programs (Howard, Sugarman, Perdomo, & Adger, 2005). These professional development initiatives range from graduate-level, credit-bearing certificate programs to on-site workshops to summer institutes. Some outreach also occurs through distance learning, professional conferences, practitioner-oriented publications of best practice, and online communication forums. Finally, audiovisual, web-based, and print materials support ongoing professional development. As bilingual/immersion education has grown internationally so too has cross-national collaboration in professional development efforts. These efforts incorporate state-of-the-art understandings of best practice in the field.

Although a growing body of literature has focused on effective bilingual/immersion teaching, the research base on bilingual/immersion teacher education and development is scant. It has generally fallen into three categories: descriptions and reviews of bilingual or immersion teacher education programs (Ross, 1993; Young, 1995; Day & Shapson, 1996;

Wilson & Kawai'ae'a, 2007); studies that articulate the specific bilingual/immersion knowledge base and pedagogical skill set (Lapkin & Swain, 1996; Pérez, 2004; Fortune et al., 2008; Södergård, 2008; Kong, 2009; Cammarata & Tedick, in press); and studies that have explored actual processes of bilingual/immersion teacher education (cf. Erben, 2004).

Much has been learned about what is needed to become an effective bilingual/immersion teacher. These teachers are professionally charged with making academic content comprehensible to students learning through a new language while simultaneously developing proficiency and literacy in that language and facilitating cross-cultural and crosslinguistic connections. To do so, they must develop special understandings and abilities including knowledge of second language acquisition and teaching; educational linguistics (Wong Fillmore & Snow, 2002); bilingual/immersion research; integrated curriculum development; counterbalanced instruction (Lyster, 2007); biliteracy development (Escamilla, Hopewell, & Ruiz, 2007); struggling learners (Fortune, 2010); and the ability to create equitable, collaborative discourse environments (Palmer, 2008), using strategies such as cooperative learning, language awareness (Dagenais, 2008), and culturally responsive pedagogy (Fitts, 2009).

Having identified the ever-evolving knowledge base of what it means to be a practitioner, we acknowledge that challenges for bilingual/immersion teacher educators remain. They include the need to address an unprecedented diversity of student and teacher backgrounds and issues, to better understand the key role that language and culture play in ensuring that today's children become linguistically and culturally competent citizens of the world, and to narrow the chasm that sometimes exists between teacher education offerings and practitioner realities.

Perhaps the greatest challenge facing teacher educators are change-resistant tertiary-level organizational structures that continue to expect preservice bilingual/immersion teachers to enroll in one program for grade-level appropriate licensure, another to find ongoing support for their second language proficiency, and yet another for bilingual/immersion-specific knowledge and skills. This situation, coupled with the lack of a critical mass of teachers that might attract more attention, has resulted in a tendency toward one-course add-ons in lieu of more thoughtfully conceptualized, well-integrated teacher education programs.

Despite challenges, the bilingual/immersion community is poised to think creatively to more appropriately address the needs of prospective and practicing teachers. Given the small numbers of these educators on the one hand and the increasing variety of target languages and program purposes on the other, it is anticipated that expansion in teacher preparation and in-service professional development efforts will involve blended distance education, web-based instructional modules, and so on. This effort will require the active participation of teacher leaders, cross-disciplinary approaches to teacher education, and judicious use of multimedia technologies. As new initiatives to meet the bilingual/immersion teacher education challenge develop, so too must research in the field expand to inform those efforts.

Bilingualism and Age

DAVID SINGLETON

Introduction

Three issues arise from any consideration of the topic of bilingualism and age. The first has to do with the relationship between age and the characterization of bilingualism; the second relates to the question of whether maturational constraints may impede progress in late bilinguals toward very high degrees of proficiency in both languages; and the third concerns the methodology of investigating maturational constraints and the possible desirability of using the proficiency of early bilinguals rather than that of native speakers as the yardstick in the evaluation of the ultimate attainment of later L2 beginners.

Characterizing Bilingualism by Reference to Age

The popular view of bilingualism tends to associate it with the kind of phenomenon referred to in early studies of bilingual development, such as those of Ronjat and Leopold, which focus on simultaneous bilingual development or bilingual first language acquisition—where two languages are acquired from infancy—as opposed to successive or sequential bilingualism, where the second language is added when the first is already to some extent established. The dividing line between simultaneous and sequential bilingualism has sometimes been set at a particular age. Thus, for example, Paradis (2008) defines simultaneous bilinguals in a recent research paper as “simultaneous-from-birth (2L1) bilinguals” and early sequential bilinguals as those “whose L2 onset began after the birth to age 3;0 period, but before age 6;0.” Baker (2006, p. 97), on the other hand, takes the line that “there are no exact boundaries between simultaneous and sequential bilingualism.”

The proposal of age 3 as the dividing line between simultaneous and sequential bilingualism has been linked to the terms of the “unitary language system hypothesis,” which posits (see, e.g., Volterra & Taeschner, 1978) differently characterized types of simultaneous bilingualism according to stage of development. The hypothesis suggests that simultaneous bilinguals begin with a single language system, a single fused linguistic representation, and that “it is only by age 3;0 that they begin to differentiate their two native languages” (Pettito et al., 2001, p. 455). The claim has been made, for instance, that the child at an early stage is not in possession of translation-equivalents across languages, but that he or she has a single lexical store, with one word from one or other of his or her languages for any given meaning. If it were truly possible to pinpoint an age at which a bilingual is capable of separating language systems, it would obviously make sense to take the age in question as the age of onset for an additional language which could, without arbitrariness, be seen as a watershed differentiating sequential from simultaneous bilingualism.

Unfortunately for such a perspective, the notion that there is a maturational point up to which the bilingual’s language knowledge is radically unitary has been shown to be dubious (see, e.g., Deuchar & Quay, 2000). The claim that the bilingual’s lexicon is systematically distributed across languages and that there is a stage (and an age) at which he or she has just one item in one or other language for a particular meaning has been undermined by research evidence, and it has also been shown that differentiation between the

bilingual's two language systems is discernible from the earliest beginnings in phonology, morphology, and syntax as well. It appears, in other words, that even very young bilingual children have the capacity to separate their languages. Other research findings indicate that bilingual children are highly adept—even at a very early age (see, e.g., Nicoladis, 1998)—with respect to deciding which language to speak to whom, and that on occasions where a bilingual child mixes languages, the mixing in question may evidence an awareness—again from the beginnings of speech—that his or her interlocutors are capable of understanding and responding to both (see, e.g., Lanza, 1997).

Maturational Constraints and Bilingual Proficiency

In much of the psycholinguistic and neurolinguistic literature the term “bilingualism” tends to be applied simply to possession of knowledge of two languages, whatever the age at which such knowledge was acquired, whatever the order of the acquisition of the knowledge in question, and whatever the degree of proficiency in the languages in question. The issue that very frequently arises in relation to age and bilingualism in this broad sense is whether the age at which exposure to a given language begins is a (or indeed the) determinant of the level of ultimate attainment in the language in question. One widely accepted line of thinking in this area has its origins in the critical-period hypothesis, which postulates that there is a biologically programmed critical period, or “window of opportunity,” for language acquisition, which closes abruptly at a particular maturational point (set at different ages by different researchers). Researchers subscribing to some version or other of the critical-period hypothesis have made the claim that, unless exposure to a given language begins before the offset point of the critical period, proficiency in that language will never be identical to that manifested by those whose exposure began at birth. A variant of this claim is that different areas of language (phonology, syntax, lexicon, etc.) have different critical ages associated with them (see, e.g., Singleton, 2005).

The claim that “late bilinguals”—that is bilinguals who begin to be exposed to one of their languages subsequent to some purported critical age—are incapable of becoming native-like in the late-begun language has been undermined by a wide array of recent studies which show late bilinguals performing at native-speaker levels (see, e.g., Birdsong, 1992; Ioup, Boustagui, Tigi, & Moselle, 1994; Bongaerts, 2003). A typical example, dealing with phonology, the area often thought to be the most vulnerable to age effects, is a study by Jedynak (2009), which found that 9 out of 35 post-pubertal L2 learners performed to native-speaker levels in terms of pronunciation of their target language, and that length of learning rather than age of onset seemed to emerge as the dominant factor relative to level of attainment. Hyltenstam and Abrahamsson (2000, p. 155) counter such evidence by pointing out that there is no recorded case of a post-pubertal L2 beginner behaving in every single detail like a native speaker, but they also recognize that very early L2 beginners tend to differ too at the level of fine linguistic detail from monoglot native speakers.

In the light of the above, it may well be that the maturational issue is a good deal less important in this connection than the fact of simply possessing knowledge of another language (see, e.g., Cook, 1995; Flege, 1999). The extent, prevalence, and complexity of crosslinguistic interaction between languages known to an individual are increasingly well documented (see, e.g., Jarvis & Pavlenko, 2007). It seems also to be the case that the degree of distance between the L1 and the L2 has an effect on the impact of crosslinguistic influence even at a young age (see Kellerman, 1995). McDonald (2000) found, for example, that learners of English from a Spanish-speaking background who had begun to be exposed to the language before age 5 were able to perform to native levels on an English grammaticality judgment test, whereas Vietnamese speakers with pre-age-5 experience of English

were not.

Age and the Monolingual Native Speaker Yardstick for Successful Bilingualism

This brings us to the question of how we are to measure the ultimate level of proficiency attained by late bilinguals. Success in this context—indeed in the study of second language acquisition and second language education generally—has tended to be interpreted as a level of achievement in the additional language which is indistinguishable from native-speaker proficiency. This approach has been challenged, however. Thus, Cook (2002) has argued that users of additional languages should be focused on in their own right rather than being compared with native speakers, and Davies has taken the line (2003, p. 213) that “the distinction native speaker–non-native speaker . . . is at bottom one of confidence and identity.”

Cook (2002, p. 6) notes in this context that, while on every side the L2 user is judged against the native speaker, and “ultimate attainment is a monolingual standard rather than an L2 standard,” there is actually no intrinsic reason why the L2 user’s attainment should be the same as that of a monolingual native speaker. On the basis of what was said earlier with respect to the interaction between language competencies and the resultant effects on language performance the logical conclusion seems to be that the appropriate comparison in the investigation of ultimate attainment in late bilingual acquisition is not between the performance of later bilinguals and that of monoglot native users of the language in question but rather between later L2 beginners and those who begin to acquire an L2 in early childhood.

Concluding Remarks

More consideration clearly needs to be given to the definition of simultaneous versus sequential bilingualism. If the age criterion cannot, given the current state of the evidence, be determined by reference to a point where language systems are putatively separated by the child, perhaps it can be arrived at on the basis of a sort of “face validity.” On this basis, age 3 (see above) may not in fact be a bad choice. Thus age 4 would seem too late on the basis that by this stage language development is already beginning to become in many respects adult-like, with, for example, child forms well on the way to elimination, and the pronoun system and sentence connectivity already fairly well established. Age 2 might seem a little early, given that language development is barely under way, with telegraphic two-element utterances barely in place. In any case, it would be useful if some age were agreed upon and adhered to in this regard across the field, for the sake of facilitating inter study comparisons.

With regard to the hypothesis that there is a maturational point beyond which a bilingual can no longer attain to native-like mastery of his or her second language, it has to be said that this point of view is very fiercely held by an entire camp of researchers. Given this, it is inevitable that research aiming to confirm this position will continue. Since large numbers of research findings challenging this position are also emerging, it seems inevitable that its advocates will continue to attempt to find “escape clauses” by discounting cases of high-performing late bilinguals who evince particular degrees of language aptitude or who have had particularly intense exposure to the second language. It is to be noted that the notion of critical period is radically changed by the use of such “escape clauses,” since in its classic form it is supposed to apply species-wide, transcending individual attributes and experiences.

It has been argued above that the appropriate yardstick for the ultimate attainment of late bilinguals is not the proficiency of the monolingual native speaker, in view of the fact that crosslinguistic effects may constitute a confounding variable with regard to age effects, but rather the proficiency of early bilinguals. This (difficult to gainsay) argument has also recently been advanced by Ortega (2010) and in all probability will in due course occasion modifications to the way in which ultimate-attainment research is conducted. To be noted, however, is that early and late bilinguals differ in terms of the degree to which the first language is entrenched before the second is acquired and that this variable will continue to confound the search for age effects.

Bilingualism and Bilinguality

LI WEI

Bilingualism and bilinguality are a result of contacts between people speaking different languages. Hamers and Blanc (1983) in their book *Bilingualité et bilinguisme* first made the distinction between the two concepts, with bilinguality referring to the effect of language contact on the individual and bilingualism referring to the effect on society as a whole.

Estimates vary as to how many languages are spoken in the world today. Most reference books give a figure of around 6,000 (e.g., Crystal, 1987; Krauss, 2007). This is in fact a conservative estimate, as many parts of the world have been insufficiently studied from a linguistic point of view. We simply do not know exactly what languages are spoken in some places. What we do know, however, is that there are fewer than 200 countries—that politico-geographic unit to which most of us belong—in the world. It is inevitable perhaps that an enormous amount of “language contact” takes place.

There is a popular metaphor in linguistics that language is a living organism, which is born, grows, and dies. However, language is a human faculty: it coevolves with us, *homo sapiens*; and it is we who give language its life, change it, and, if so desired, abandon it. When we speak of “language contact,” we are therefore talking about people speaking different languages coming into contact with one another.

There are many reasons for speakers of different languages to come into contact. Some do so out of their own choosing, while others are forced by circumstances. Key external factors contributing to language contact include (for further discussion, see Baker & Prys Jones, 1998; Li, 2007):

- Politics: Political or military acts such as colonization, annexation, resettlement, and federation can have immediate linguistic effects. People may become refugees, either in a new place or in their homeland, and have to learn the language of their new environment. After a successful military invasion, the indigenous population may have to learn the invader’s language in order to prosper. Colonization is exemplified by the former British, French, Spanish, Portuguese, and Dutch colonies in Africa, Asia, and South America, most of which achieved independence in the 19th and 20th centuries. A modern example of annexation can be found in the absorption of the Baltic republics—Lithuania, Latvia, and Estonia—into the Soviet Union after the World War II. In the latter part of the 20th century military conflicts in Central Africa and the former Yugoslavia saw the resettlement of people of different ethnic backgrounds. Examples of federation where diverse ethnic groups or nationalities are united under the political control of one state include Switzerland, Belgium, and Cameroon.
- Natural disaster: Famine, floods, volcanic eruptions, and other such events can be the cause of major movements of population. New language contact situations then emerge as people are resettled. Some of the Irish and Chinese resettlements in North America were the result of natural disasters.
- Religion: People may wish to live in a country because of its religious significance, or to leave a country because of its religious oppression. In either case, a new language may have to be learned. Russian-speakers in Israel are a case in point.

2 BILINGUALISM AND BILINGUALITY

- Culture: A desire to identify with a particular ethnic, cultural, or social group usually means learning the language of that group. Minority ethnic and cultural groups may wish to maintain their own languages, which are different from the languages promoted by the governing state or institution. Nationalistic factors are particularly important.
- Economy: Very large numbers of people across the world have migrated to find work and to improve their standard of living. This factor accounts for most of the linguistic diversity of the USA and an increasing proportion of the bilingualism in present-day Europe.
- Education: Learning another language may be the only means of obtaining access to knowledge. This factor led to the use of Latin in the Middle Ages, and today motivates the international use of English.
- Technology: The availability of information and communication technologies (ICT), such as the Internet, has led to a further expansion of the use of English across the world. The vast majority of ICT users are non-native speakers of English.

From the above list we can see that one does not have to move to a different place to come into contact with people speaking a different language. There are plenty of opportunities for language contact in the same country, the same community, the same neighborhood, or even the same family.

Bilingualism

One consequence of language contact is bilingualism, or even multilingualism, at the societal level. There are many different kinds of societal bilingualism. The following three are typical cases:

- Territorial bilingualism: Groups of speakers of specific languages find themselves mostly within their own geographically and politically defined territories. Each group's language or languages are protected by legislations and institutional support, while other languages are also available, though without official status. Territorial bilingualism can be found in countries such as Belgium, Canada, India, Spain, and Switzerland, which apply the principle of territorial bilingualism in different ways.
- Diglossia: Two (or more) languages coexist at the community level but are used by sections of the society in a complementary way, one language having a higher status than the other and being used in certain functions and domains that are different from those for the other language. It is important to remember that diglossia is a construct to describe the relationship between two or more languages; it is not a static state of language use. Over time, the relationships between the different languages may change, due to various social factors, and the diglossic configuration can become highly complex. Examples of diglossia include simple binary diglossia of Guarani versus Spanish in Paraguay; double overlapping diglossia of African vernacular versus Swahili and Swahili versus English in Tanzania; double nested diglossia of Sanskrit versus Hindi versus Khalapur in India; linear polyglossic diglossia of English, Mandarin Chinese, Malay, Tamil, other Chinese, other Malay, and other Indian languages in Singapore; and complex triglossia of standard French and Dutch versus Belgian French and Belgian Dutch versus local dialects (Walloon and Flemish) in the Belgian capital of Brussels.
- Widespread multilingualism: In many countries of Africa, Asia, and Latin America, many different kinds of native languages of indigenous ethnic groups or nations coexist with one or more languages of wider communication. The majority of the people of these communities are also highly multilingual.

In all bilingual societies, how to manage the relationships across the different languages is a critical question. This gives rise to issues such as language maintenance and language shift, language planning and language policy.

Language maintenance refers to relative stability in number and distribution of language speakers and the retention of the language in specific domains, for instance, family, school, religion. Language shift, on the other hand, refers to the replacement of one language by another in specific domains. It is a progressive process whereby a language community shifts to speaking a different language. Such changes in language choice preferences happen across generations within a linguistic community. A host of factors may lead to language maintenance or language shift, ranging from political, social, and demographic factors (e.g., recent or continuing migration, social and economic mobility, ethnic identity) to cultural and linguistic factors (e.g., mother-tongue institutions, emotional attachment, cultural or religious festivals and activities, written text, and home literacy).

One possible long-term consequence of language shift may be language decline or even language death, a process that affects whole communities where the level of linguistic competence that speakers possess of a given language is decreased, eventually resulting in no native or fluent speakers of the language. Classic studies of language shift and language death include Gal's (1979) investigation of the replacement of Hungarian by German in the town of Oberwart in eastern Austria, where after 400 years of relatively stable maintenance of Hungarian–German bilingualism, economic, social, and family life became more industrialized and German-language based, and Dorian's analysis of east Sutherland in the northeast Highlands of Scotland, where the number of speakers of Gaelic, a language with low prestige, continuously declined throughout the 20th century, together with the decline of the traditional fishing industry, to the extent that Gaelic speakers stopped transmitting the language "to their children so that no replacement generation is available when the parent generation dies away" (Dorian, 1981, p. 105). Kulick's (1992) study of language and cultural changes among the villagers of Gapun, in the Sepik region of Papua New Guinea, shows that despite their strong attachment to their own language as a source of identity and as a tie to their lands, people are abandoning their vernacular in favour of Tok Pisin, the most widely spoken language in Papua New Guinea. By examining village language socialization practices, Kulick reveals how daily interactions, attitudes towards language, children, change, and personhood all contribute to a shift in language and culture that is beyond the villagers' understanding and control.

According to UNESCO (2003), a language is endangered "when its speakers cease to use it, use it in an increasingly reduced number of communicative domains, and cease to pass it on from one generation to the next. That is, there are no new speakers, adults or children." Currently the *UNESCO Atlas of the World's Languages in Danger* lists over 3,000 languages as endangered. There have been many attempts to slow or reverse language shift, decline, and death. The success of such attempts is often limited. The revival of the Hebrew language in Israel is often cited as the example of a language that has gained new first language speakers after it became extinct in everyday use for an extended period. But even in the case of Hebrew, the result of revitalization is a multifaceted Israeli language, which is multisourced. Other cases of language revitalization which have seen some degree of success are Welsh and Hawaiian.

Joshua Fishman, who devoted much of his intellectual life to the study of societal multilingualism, proposed a model for reviving threatened (or dead) languages, or for making them sustainable. The model consists of an eight-stage process. The eight stages are as follows (Fishman, 1991):

1. Acquisition of the language by adults, who in effect act as language apprentices (recommended where most of the remaining speakers of the language are elderly and socially isolated from other speakers of the language).

4 BILINGUALISM AND BILINGUALITY

2. Create a socially integrated population of active speakers (or users) of the language (at this stage it is usually best to concentrate mainly on the spoken language rather than on the written language).
3. In localities where there are a reasonable number of people habitually using the language, encourage the informal use of the language among people of all age groups and within families and bolster its daily use through the establishment of local neighborhood institutions in which the language is encouraged, protected, and (in certain contexts at least) used exclusively.
4. In areas where oral competence in the language has been achieved in all age groups, encourage literacy in the language but in a way that does not depend upon assistance from (or goodwill of) the state education system.
5. Where the state permits it, and where numbers warrant, encourage the use of the language in compulsory state education.
6. Where the above stages have been achieved and consolidated, encourage the use of the language in the workplace (lower worksphere).
7. Where the above stages have been achieved and consolidated, encourage the use of the language in local government services and mass media.
8. Where the above stages have been achieved and consolidated, encourage use of the language in higher education, government, and so forth.

This model of language revival is intended to direct efforts to where they are most effective and to avoid wasting energy trying to achieve the later stages of recovery when the earlier stages have not been achieved. For instance it is probably wasteful of effort to campaign for the use of the language on television or in government services if hardly any families are in the habit of using the language.

Bilinguality

The impact of language contact on the individual results in bilinguality of various kinds. The different sociohistorical processes of language contact lead to many different types of bilingual and multilingual language users. For instance, at an individual level, some people may become bilingual or multilingual because they are born into bilingual or multilingual families and are exposed to multiple languages simultaneously from birth, while others learn and acquire additional languages at a later age in life due to schooling or changes in life experience. Romaine (1995), extending the typology by Harding and Riley (1986), identifies six different processes whereby children can become bilingual or multilingual (see Table 1).

In theory, these different routes to bilinguality would result in different bilingual behavior and cognitive organizations of the bilingual brain. But at the moment, there is very little systematic research linking the process of language contact with the outcome of bilinguality at the individual level.

One of the questions that concern researchers of bilinguality is what it means to be bilingual. For example, does a bilingual speaker's brain function differently from that of a monolingual's brain? In the majority of right-handed adults, the left hemisphere of the brain is dominant for language processing. There is some evidence to suggest that adult second language acquisition involves the right hemisphere more than first language acquisition in language processing. As proficiency in a second language grows, right hemisphere involvement decreases and left hemisphere involvement increases. However, quantitative analyses of the existing data often show that the left hemisphere strongly dominates language processing for both monolinguals and bilinguals, and that differences between them

Table 1 Processes of bilingual acquisition (based on Romaine, 1995)

	<i>Parent</i>	<i>Community</i>	<i>Strategy</i>
1. One person one language	The parents have different native languages with each having some degree of competence in the other's language.	The language of one of the parents is the dominant language of the community.	The parents each speak their own language to the child from birth.
2. Non-dominant home language/one language one environment	The parents have different native languages.	The language of one of the parents is the dominant language of the community.	Both parents speak the non-dominant language to the child, who is fully exposed to the dominant language only when outside the home, and in particular in nursery school.
3. Non-dominant home language without community support	The parents share the same native language.	The dominant language is not that of the parents.	The parents speak their own language to the child.
4. Double non-dominant home language without community support	The parents have different native languages.	The dominant language is different from either of the parents' languages.	The parents each speak their own language to the child from birth.
5. Non-native parents	The parents share the same native language.	The dominant language is the same as that of the parents.	One of the parents always addresses the child in a language which is not his/her native language.
6. Mixed languages	The parents are bilingual.	Sectors of community may also be bilingual.	Parents code switch and mix languages.

are the exception rather than the rule. Bilinguals do not seem to vary from monolinguals in neurological processes; the lateralization of language in the brains of the two groups of speakers is similar (Obler and Gjerlow, 1998; Fabbro, 1999).

A related issue concerns the mental representation of a bilingual's two languages and the processing emanating from such representation. Evidence exists for both separate storage and shared storage of the two languages in the bilingual's brain, resulting in the suggestion that bilinguals have a language store for each of their two languages and a more general conceptual store. There are strong, direct interconnecting channels between each of these three separate stores. The interconnections between the two languages comprise association and translation systems, and common images in the conceptual store act as mediators. Furthermore, speakers of different proficiency levels or at different acquisitional stages vary in the strength and directness of the interconnections between the separate stores in language processing; for instance, those highly proficient in two languages may go directly from a concept to the target language, while those whose second language is weaker than their first tend to use the first language to mediate (Kroll & Tokowicz, 2005).

Although the more general definitions of bilinguality would include people who understand a second language—in either spoken or written form or both—but do not necessarily speak or write it, a more common usage of the term refers to someone who can function in both languages in conversational interaction. Bilingual speakers choose their languages according to a variety of factors, including the type of person addressed (e.g., members of the family, schoolmates, colleagues, superiors, friends, shopkeepers, officials, transport personnel, neighbors), the subject matter of the conversation, location or social setting, and relationship with the addressee. However, even more complex are the many cases when a bilingual talks to another bilingual with the same linguistic background and changes from one language to another in the course of conversation. This is what is known as code switching.

There is a widespread impression that bilingual speakers code switch because they cannot express themselves adequately in one language. This may be true to some extent when a bilingual is momentarily lost for words in one of his or her languages. However, code switching is an extremely common practice among bilinguals and takes many forms. A long narrative may be divided into different parts which are expressed in different languages; sentences may begin in one language and finish in another; words and phrases from different languages may succeed each other. Linguists have devoted much attention to the study of code switching. It has been demonstrated that code switching involves skilled manipulation of overlapping sections of two (or more) grammars, and that there is virtually no instance of ungrammatical combination of two languages in code switching, regardless of the bilingual ability of the speaker. Some suggest that code switching is itself a discrete mode of speaking (Gardner-Chloros, 2009).

One important aspect of code switching is that the two languages involved do not play the same role in sentence making. Typically one language sets the grammatical framework, with the other providing certain items to fit into the framework. Code switching therefore is not a simple combination of two sets of grammatical rules but grammatical integration of one language in another. Bilingual speakers of different proficiency levels in their two languages or speaking two typologically different languages can engage in code switching and indeed vary it according to their needs.

There is another group of bilinguals who engage themselves in cross-modality language production. This is the case with speech–sign bilinguals who, in addition to the oral modality, use the manual–visual modality in everyday communication. They are special in one aspect, in that the two different modalities allow for the simultaneous production of the two languages. In other words, one can speak and sign at the same time. Research has shown that such simultaneous bimodal production is typically exemplified by the use of lexical items from both languages but only one set of grammatical rules, which is usually from the spoken language. Right now we know relatively little about how the two linguistic systems interact in the language production and processing of speech–sign bilinguals (for a review of existing studies of sign bilingualism, see Dufour, 1997). Indeed, much more work needs to be undertaken before we can fully appreciate the complexity of the language behavior of bilinguals generally.

Bilinguality changes over the life span. Children who are exposed to two or more languages from birth are usually described as simultaneous bilinguals, while people who learn additional languages after a first language is acquired are sequential bilinguals. Interactions between the different languages are a key issue for research in simultaneous bilinguals, and interference of and transfer from one language to another are central to the study of sequential bilinguals (De Houwer, 2009). Language attrition is a process similar to language shift but at an individual level. It refers to the loss of a first or second language or a portion of that language by individual speakers. It can happen at any point in time during an individual's life span, because the necessary contact with speakers of

that language is lacking over a lengthy period. It can also happen to elderly bilinguals who experience cognitive decline of some kind. Research evidence suggests that certain linguistic structures are more vulnerable to attrition. Identifying these linguistic structures and why they are vulnerable to attrition then becomes the central issue of investigation in language attrition research (Schmid, Köpke, Keijzer, & Weilemar, 2004).

Bilingualism and bilinguality are outcomes of language contact at two related levels, societal and individual. And language contact is an important field of study in applied linguistics, which has been approached from a variety of methodological perspectives. One of the key findings of the work by linguists is the dynamic nature of language contact. Causes, processes, and outcomes differ from and interact with each other, depending on the sociohistorical context. Understanding the dynamic nature of language contact, hence bilingualism and bilinguality, requires systematic, multidisciplinary, and comparative investigations in different communities and speaker groups. Such work has important implications for policy and practice in a variety of fields including education, community relations, management, and intercultural communication.

Bilingualism and Cognition

ANNETTE M. B. DE GROOT

Scientific interest in the effects of (individual) bilingualism on cognition dates back to at least the first quarter of the 20th century, as illustrated by two articles that were published in 1923 on the relation between bilingualism and mental development (Smith, 1923) and between bilingualism and intelligence (Saer, 1923). In addition to engaging scientists, the question of whether and how bilingualism affects cognition also concerns policy makers, educators, and parents of bilingual families. The reason for this widespread interest in this issue plausibly is the high incidence of bilingualism and the appreciation that knowing about the way in which bilingualism affects cognition is a prerequisite for creating the circumstances that foster any of its beneficial effects on cognitive functioning while at the same time preventing any adverse effects it might have. In one domain of cognition, namely, language representation and use, the influence of bilingualism is ubiquitous, affecting all components of the language system, but there is also plenty of evidence to suggest that bilingualism affects nonlinguistic cognitive domains as well. In this entry the influence of bilingualism on language (verbal cognition) will first be discussed and, next, its effect on various aspects of nonverbal cognition.

Bilingualism and Language

That bilingualism affects language can be concluded from the results of myriad studies showing that a bilingual's two languages constantly interact with one another instead of there being solid mental firewalls between them. It appears that even a purely unilingual communicative setting does not prevent the other language from being simultaneously active and influencing the way in which the contextually appropriate language is processed. This holds for both language comprehension (e.g., Marian & Spivey, 2003) and language production (e.g., Colomé, 2001). The inevitable consequence of the inherently interactive nature of the bilingual language system is that the linguistic expressions of bilinguals differ from the analogous expressions of monolingual speakers. In other words, bilinguals do not equal two monolinguals in one person, and the linguistic expressions of monolinguals should not be considered the norm against which the language of bilinguals is evaluated (doing so would inevitably lead toward the conclusion that bilinguals' language use is inferior). Contrary to such a "fractional" view of bilingualism, a "holistic" (Grosjean, 1989) or "multi-competence" (Cook, 2003) view of bilingualism acknowledges the inherently interactive nature of the bilingual language system. This more realistic view holds that the frequent use of two languages produces a specific linguistic competence, one that differs from the competence of a monolingual speaker-listener but that is by no means inferior to it. Grosjean clarified this idea with an analogy derived from the domain of sports: "When compared individually with the sprinter or the high jumper, the hurdler meets neither level of competence, and yet when taken as a whole the hurdler is an athlete in his or her own right" (Grosjean, 1989, p. 6).

Most studies on language interaction (also called "crosslinguistic influence" or "transfer") in bilinguals have looked at the influence of the native, first language (L1) on using the second (L2), ignoring the possibility that L2 may also influence L1. Laufer (2003) suggests

there might be two reasons for this. The first relates to the fact that many researchers in applied linguistics have been especially interested in L2 learning, and particularly in the earliest stages of this process. Crosslinguistic influences during these early stages of learning are almost entirely from the stronger L1 to the still weak L2 rather than from L2 to L1. The second reason suggested by Laufer is that much of the work on L2 learning has been motivated by the question of how members of immigrant communities can come to master the dominant language of the host community, the immigrants' L2, as rapidly as possible. Consequently, research primarily focused on how the L2 was acquired rather than on what happened to the L1 in the process. Whatever the reasons for the relative lack of studies looking at a cross-language influence of L2 on L1, evidence is accumulating that the L1 is influenced by later languages, be it L2 or any other later language, and that such an influence affects all linguistic domains: phonology, morphology, syntax, lexicon, conceptual representation, and pragmatics (Pavlenko, 2000).

Language interaction in bilinguals is manifest in accented speech, that is, the production of particular linguistic elements that differ from the way monolingual speakers would produce these elements. In addition, it is manifest in accented comprehension, that is, in deviations from the way in which monolingual listeners or readers process analogous language input. Examples from the domains of phonology, grammar, and semantics will be presented below. (Note that the word "accent" is used in a broad sense here, referring to differences in both language production and language comprehension in bilinguals as compared with monolinguals, and to differences in all linguistic subdomains, not just phonology.) Two possible sources of these accents are considered in the literature. One is parallel activation of representations of linguistic elements in a bilingual's two language subsystems even when they have selected one of their languages (the "target" language) for current use. Because the language system of monolinguals only stores linguistic units belonging to one and the same language, such parallel activation does not occur when monolinguals process language. According to this view, the representation units themselves do not need to differ between monolinguals and bilinguals. For instance, the representation of the English phoneme /t/ and the stored meaning for English *cat* in an English–French bilingual are identical to the representation of English /t/ and the stored meaning of English *cat* in a monolingual English speaker. The second possible source of bilingual speech accents is that bilinguals may have developed memory representations of specific linguistic units that differ from the representations of the corresponding units in monolingual memory. For instance, bilinguals may have developed representations that merge a pair of corresponding representations in monolingual speakers of their two languages. The former source of accents may be regarded a difference in processing or "performance"; the latter a difference in knowledge or "competence."

Phonological Accents

In a series of studies, Flege and his collaborators have shown a phonological accent, in both L1 and L2, when bilinguals produce speech sounds (e.g., Flege, 2002). In some of these studies the researchers measured the so-called "voice-onset time" (VOT) of consonants spoken by bilinguals and monolinguals in the context of a larger language fragment. The VOT is the time between the release of the air and the moment the vocal cords start to vibrate when a speaker produces a consonant. The VOT for one and the same consonant may differ between languages. For instance, the consonant /t/ is spoken with a longer VOT in English than it is in French and Spanish. This fact gives rise to the question of how bilingual speakers of two languages that exploit different VOT values in producing one and the same consonant utter this consonant. Flege and his colleagues have shown that the VOT values of such consonants differ between monolinguals and bilinguals.

Specifically, when spoken by bilinguals these consonants take on VOT values that are intermediate between those of the same consonants spoken by monolingual speakers of the two languages concerned. For instance, if English–French bilinguals and English monolinguals are asked to pronounce the speech fragment *two little dogs*, the VOT of the /t/ sound in *two* is shorter for the English–French bilinguals than for the English monolinguals. Conversely, if English–French bilinguals and French monolinguals are asked to pronounce the speech fragment *tous les chiens* ‘all dogs’, the VOT of the /t/ sound in *tous* is longer for the English–French bilinguals than it is for the French monolinguals.

Flege (2002) attributed phonological accents of this type to two L2 speech learning processes that both result in representations of phonetic categories in bilingual memory that differ from the representations of the corresponding categories in monolingual memory. One of these processes, “phonetic category assimilation,” is thought to lead to representations that merge closely similar L1 and L2 sounds into a single phonetic category in memory. The second, “phonetic category dissimilation,” is thought to be operative when an L2 sound is very different from all L1 sounds stored in memory. A separate representation for the new L2 sound is then formed in memory, but the position it takes up in phonetic space differs from the position occupied by this sound in monolingual speakers of the language concerned. Furthermore, while inserting a phonetic category for this new sound into the phonetic space, it pushes away one or more of the categories that represent L1 sounds from their original positions (causing an accent).

Grammatical Accents

A grammatical accent in bilinguals’ language processing can, for instance, be witnessed by looking at the way bilinguals parse structurally ambiguous sentences for which the preferred solution differs between their two languages. Consider the Spanish sentence *Alguien disparó contra el hijo de la actriz que estaba en el balcón* (‘Someone shot the son of the actress who was on the balcony’). In sentences of this type, either the head of the complex noun phrase (*el hijo* ‘the son’) or the second noun in this phrase (*la actriz* ‘the actress’) can be the subject of the relative clause (*que estaba en el balcón*). Spanish favors a “high-attachment” solution of this construction, assigning *el hijo* the role of subject of the relative clause. Conversely, English favors a “low-attachment” analysis, in which *la actriz* is assigned this role.

Dussias and her colleagues (e.g., Dussias, 2003; Dussias & Sagarra, 2007) examined how Spanish–English bilinguals parse sentences of this type. The results suggested an influence of the other language on the way bilinguals analyze them and, furthermore, that the context of testing may modulate this effect: When testing took place in a predominantly English-speaking environment in the USA, both Spanish-L1–English-L2 and English-L1–Spanish-L2 bilinguals generally favored low attachment over high attachment irrespective of the language of the presented sentences, English or Spanish (Dussias, 2003). In other words, in both the L1- and L2-speakers of Spanish, the Spanish sentences were analyzed according to the English-like parsing strategy. In a further study Spanish sentences only were presented, in either an L1 Spanish or an L2 English immersion environment, to Spanish-L1–English-L2 bilinguals and to Spanish monolingual control subjects. The bilingual participants immersed in L1 Spanish behaved like the monolingual Spanish control subjects, favoring high attachment. In contrast, the bilingual participants immersed in L2 English preferred the low-attachment solution that is favored in English.

Semantic Accents

Languages differ from one another in the way their vocabularies carve up conceptual space and the physical world. For instance, both Russian and English have separate words for

glasses and cups (*stakany* and *chashki* in Russian), but the exact reference of these words differs between the two languages: Paper cups are called *stakanchiki* (small glasses) in Russian (Pavlenko, 2005). One of the best known examples of differential word-to-concept mapping across languages concerns the way separate languages have lexicalized the color spectrum. Languages vary widely in the number of color words they possess to describe this spectrum and, of course, the number of color words used in a specific language has consequences for the exact reference of each of these words: The smaller the number of color words, the larger the range of hues referred to by each of them.

Since around 1960 a couple of studies have been published on the consequence of this crosslinguistic variability in color terminology for color categorization in bilinguals. One of these studies concerned a detailed investigation of color naming in Navaho–English bilinguals and Navaho and English monolinguals (Ervin, 1961). Ervin first performed a detailed contrastive analysis of the color systems of Navaho and English. This analysis revealed, for instance, that *litso*, the closest Navaho translation of *yellow*, is the favored response of monolingual Navaho speakers to hues across a much larger part of the color spectrum than the range of hues exciting *yellow* in monolingual speakers of English. Furthermore, the commonality of Navaho monolinguals' *litso* responses at its peak (that is, at the point that represented the focal color *litso*) was much larger (89%) than the commonality of English monolinguals' *yellow* responses at its peak (34%). Assuming an influence from the colors' names in the non-target language, Ervin expected the response probabilities in the target language to differ in bilinguals as compared with monolinguals. For instance, she expected that more Navaho–English bilinguals than English monolinguals would respond with *yellow* upon the presentation of focal yellow and the instruction to respond in English. Similarly, when presenting focal *litso* and inviting a response in Navaho, bilinguals were expected to produce fewer *litso* responses than monolingual Navaho controls. These predictions were borne out by the data, as were those derived from other differences between the color systems of Navaho and English as revealed in the contrastive analysis.

Ervin explained these results in terms of coactivation in memory of the representation of the presented color's name in the non-response language. For example, a Navaho–English bilingual may say *tatLqid* ('green') to a color patch that most Navaho monolinguals would call *litso* ('yellow') because the common English name for the depicted color (*green*) is coactivated with *litso*. *Green* then activates *tatLqid* via a connection between these two words in memory and *tatLqid* emerges as the response. An alternative account of these semantic accents is in terms of differences in the conceptual representations of color words between bilinguals and monolinguals. This is how Caskey-Sirmons and Hickerson (1977) explained the results of a similar study wherein English L2 speakers with various Asian languages as L1 were tested. Specifically, these authors assumed that, in the course of acquiring L2 English, broader conceptual representations of color words had come into being that merged the concepts associated with L1 color words and those associated with these words' closest L2 translation.

Bilingualism and Nonverbal Cognition

Bilingualism and Linguistic Relativity

The above discussion on how languages differ in the way they map words onto concepts implicitly introduced the theory of "linguistic relativity," that is, the idea that language influences thought or, more precisely, that differences between languages in the way they encode aspects of the surrounding world cause speakers of different languages to think differently about the world. According to this idea, the fact that Navaho and English split

up the world of colors differently causes monolingual speakers of Navaho to think about, and perhaps perceive, colors differently from monolingual speakers of English. The theory not only applies to nominal concepts but also to grammatical concepts such as tense, number, and gender. For example, the fact that verb forms in English but not in Indonesian contain tense markers (information about the time of the event or action described by the verb: past, present, or future) is thought to result in different time cognition in speakers of English and Indonesian. Benjamin Lee Whorf (1897–1941) is regarded as the major advocate of this view, which is known as the Sapir–Whorf hypothesis (after Whorf and his mentor Edward Sapir).

Studies on the relation between language and thought have typically compared the performance of monolingual speakers of two languages that differ from one another in one selected aspect, such as grammatical tense, gender, or number. Bilingual studies on linguistic relativity are sparse. Yet bilingualism has the potential to contribute importantly to this debate because it may be that “bilinguals are the only ones to experience directly the effects of linguistic relativity” (Pavlenko, 2005, p. 437). Do bilinguals experience different conceptual worlds when they speak their one or other language (a form of bilingualism that in the older literature is known as “coordinate bilingualism”)? If so, is each of them identical to the conceptual world of monolingual speakers of the languages concerned? In the case of sequential bilingualism (where L2 acquisition starts after L1 acquisition), are there intermediate states prior to the end state of experiencing two conceptual worlds and, if so, what are they? Or is it perhaps the case that bilinguals have developed a blended conceptual world shared by the two languages and different from the conceptual world of monolingual speakers of either language (known as “compound bilingualism”)? Recent bilingual studies on linguistic relativity suggest that some structural contrasts between a bilingual’s two languages become reflected in conceptual representations that differ from those of monolingual speakers of these languages (e.g., Bassetti, 2007, a study on the effects of grammatical gender differences between Italian and German on the mental representation of objects; Athanasopoulos & Kasai, 2008, a study that examined the effect of grammatical number differences between English and Japanese on object representation). At least one bilingual study, testing the grammatical tense contrast between English and Indonesian (Boroditsky, Ham, & Ramscar, 2002), suggests that bilinguals can switch between two language-specific modes of thinking and that this mental reset can be triggered by just a modicum of language.

Bilingualism and Intelligence

Until well beyond the middle of the 20th century the view prevailed that bilingualism is detrimental for intelligence and cognitive functioning in general. A study by Peal and Lambert (1962) marked a change from this view to the opinion that, under specific conditions, bilingualism is in fact beneficial for intelligence and cognition (including linguistic competence). In this study 10-year-old French–English bilingual and French monolingual children from middle-class French schools in Canada’s Montreal region were administered a number of tests that measured their verbal and nonverbal intelligence. Whereas earlier similar studies had generally shown a disadvantage for bilingual children as compared with monolingual peers, the bilingual children now performed significantly better than the monolingual children on the vast majority of all tests and subtests, both the ones that measured verbal intelligence and those measuring nonverbal intelligence. The bilingual advantage was, for instance, manifest in tasks that assessed concept formation ability and mental flexibility, and the bilingual children showed a more diversified set of mental abilities than the monolingual children.

To account for the discrepant results, Lambert (1977) highlighted one potentially crucial feature of the Peal and Lambert (1962) study, namely, the fact that in the Montreal region

both French and English are socially highly valued and respected languages. Therefore, the acquisition of English by children with French as their home language does not involve the risk of French getting corrupted as a consequence of a social pressure not to use it. This form of bilingualism, where an L2 is added onto an L1 that does not suffer a cost, has been coined “additive bilingualism,” and it is this form of bilingualism that is advantageous for cognition. The counterpart of additive bilingualism is “subtractive bilingualism.” In this form of bilingualism, for one reason or other (e.g., national and educational policies), the use of the L1 is discouraged with the effect that it is gradually replaced by L2. This form of bilingualism is detrimental for cognitive functioning. Plausibly, the earlier studies had accidentally tested bilinguals of the subtractive type. A further possible cause of the deviant results is that many of the earlier studies lacked experimental rigor, for instance, by not matching the bilingual participants and their monolingual controls on age, socioeconomic status, and amount of education (see Hakuta & Diaz, 1985, for a review). It may have been the case that the earlier studies tested bilingual children that tended to be younger or of a lower socioeconomic status, or less educated than the monolingual controls partaking in those studies. In all these respects, Peal and Lambert’s study compared favorably with the earlier ones.

Bilingualism and Executive Control

Since Peal and Lambert’s (1962) seminal investigation, detailed knowledge has been gathered about the aspects of cognition in which bilinguals excel. To conclude this entry, one of these aspects will be singled out here, namely, the skill of executive control (also called “attention control” or “cognitive control”). As already pointed out above, when bilinguals use one of their languages, the other language is simultaneously active as well. In order to select the targeted language, “language control” must be exerted, that is, the contextually inappropriate language must be suppressed or the contextually appropriate language must be selectively attended to. It is generally assumed that language control is effectuated by more general processes and mechanisms of executive control, that is, processes and mechanisms that take care of the control of action in general. If true, the requirement to incessantly control their two languages must have boosted bilinguals’ ability to exert executive control in general and, consequently, bilinguals should be better than monolinguals when they perform nonverbal tasks that require executive control. This prediction came true in several studies, using different experimental tasks. It was for instance confirmed in a series of studies by Bialystok and her colleagues (e.g., Bialystok, Craik, Klein, & Viswanathan, 2004) in which bilinguals and monolingual controls performed the so-called “Simon task,” a perceptual-motor task that assesses the participants’ ability to inhibit or ignore irrelevant information (an ability that requires executive control).

Bilingualism has become an omnipresent phenomenon in the modern world and it may not take long before monolingual speakers can hardly be found anymore. It is a promissory side effect of this inevitable development toward bilingualism as the norm that, in the process, human’s average cognitive skills will be lifted—as is suggested by the current research on the relation between bilingualism and nonverbal cognition.

Bilingualism and Multilingualism: Quantitative Methods

JUDITH F. KROLL AND ELEONORA ROSSI

Overview

Experimental approaches to bilingualism and multilingualism have developed at a rapid pace in the past 20 years (e.g., Kroll & De Groot, 2005). In part, this new field of research represents the application of new and existing methods in psycholinguistics and cognitive neuroscience to language processing in the first (L1) and second (L2) languages in bilinguals and L2 learners. It also reflects the realization that research on bilinguals and multilinguals holds the potential to reveal insights about language representation and processing that are otherwise obscured in monolingual language users who speak only one language. In some respects, the acquisition and use of two languages challenges the interface between language and cognition by requiring that the intended language be used in the correct context and by drawing on cognitive resources that allow the mental juggling of the two languages to be performed with skill. But in other respects, multiple language use is perfectly natural and the prevalence of multilingual speakers in many places in the world suggest that studies of language processing among speakers of more than one language will provide the most accurate picture of human language ability.

In this brief overview we consider illustrative experimental approaches to the acquisition, comprehension, and production in L2 learners and bilinguals. We include discussion of two different but related quantitative methods, one using behavioral measures of performance and the other using neural measures of performance. The behavioral methods include the response time to perform a language task, the accuracy of performance, the record of eye fixations as individuals read or listen to spoken language, and the acoustic record of what individuals say when they speak (see Kroll, Gerfen, & Dussias, 2008, for an overview of behavioral methods). The neural methods include event-related potentials (ERPs) and functional magnetic resonance imaging (fMRI). ERPs provide a sensitive record of the time course of the earliest stages of language processing whereas fMRI provides information on the spatial localization of language functions in the brain (e.g., Van Hell & Tokowicz, 2009). In each of the sections that follow, we illustrate the way in which these methods have been used to elucidate acquisition, comprehension, and production in two languages. In the section on production we include a detailed analysis of a hypothetical study that will serve as an example for researchers interested in pursuing behavioral research methods on bilingualism. Although there is an extensive literature on bilingualism in children, we focus our review on the methods that have been used to investigate adult bilingualism although ingenious methods have been developed to investigate early language abilities in bilingual children.

Acquisition

Learning a second language as an adult is a difficult process that produces mixed outcomes, particularly for the grammar and the phonology. Late L2 learners often speak the L2 with

an accent (e.g., Piske, MacKay, & Flege, 2001) and fail to make distinctions among aspects of the grammar (e.g., Johnson & Newport, 1989). Much of the research on adult L2 learning has addressed the development of skill in the L2 relative to the existing L1 and relative to the performance of individuals who speak the L2 as their native language. The evidence on these issues has been largely based on the use of behavioral tasks such as grammaticality judgments (e.g., deciding whether a sentence is grammatically acceptable) and ratings of the degree of accentedness of a non-native speaker's sentence production. More recently, there has been an attempt to characterize the development of L2 proficiency by using online tasks in which the speed and accuracy of processing can be examined more sensitively. We describe some of the methods used to assess the processing of written and spoken sentences below in the section on comprehension. Here we illustrate quantitative approaches to L2 acquisition by describing measures of lexical processing that have been used to investigate the earliest stages of adult L2 learning.

The logic in many studies examining the acquisition of lexical proficiency in the L2 has been to determine the degree to which there is evidence of activity of the language not in use. Early research suggested that during the first stages of adult L2 learning, there is activation of the translation equivalent in L1 but that once some level of skill is achieved, the dependence on L1 transfer diminishes (e.g., Kroll & Stewart, 1994). Later studies have provided compelling evidence to demonstrate that the activation of the language not in use continues once individuals become relatively proficient bilinguals, although the form of cross-language influence may change with increasing L2 skill (e.g., Dijkstra, 2005). The performance of highly proficient bilinguals on even simple word recognition tasks such as lexical decision (i.e., is a string of letters a real word in a given language?) shows that bilinguals cannot help but activate the language not in use. Bilinguals are faster than monolinguals to recognize words that are cognate translations, with similar spelling and phonology across language (e.g., the word *hotel* in Dutch and English), but they are often slower to recognize interlingual homographs or false friends that have similar form but different meanings in their two languages (e.g., such as the word *room* which means cream in Dutch).

One paradigm that has been used to assess lexical development in the L2 is translation recognition. A word is presented in one language and then followed by a word in the other language. The task is to decide whether the second word is the correct translation of the first. Critically, translation recognition requires only a "yes" or "no" response so that learners do not need to produce the word in the L2. To determine what sort of information learners activate when they process the L2 word, the "no" trials can be manipulated to include distractors that are similar to the target translation in word form or meaning. For example, if the word *man* (English) were followed by the word *hombre* (Spanish), the correct response would be "yes" that the second word is the translation of the first. However, if the English word *man* were followed by the Spanish word *hambre* (meaning hunger), the correct response would be "no" although *hambre* resembles the correct translation. A number of studies have tested L2 learners under these conditions to ask what sort of information is active when an L2 word is processed (e.g., Sunderman & Kroll, 2006). When distractors that require a "no" response are related in form, meaning, or both to the correct translation, response times are typically longer to reject the second word as not being the correct translation relative to a control condition in which the distractor is completely unrelated to the translation (e.g., the word *man* followed by *casa*, the Spanish word meaning house). The difference between the related and unrelated distractors is taken to be a measure of interference or sensitivity to that the particular dimension along which the distractor is related to the target translation. The general result in these studies is that both form and meaning distractors produce interference in response times, with longer "no"

responses for related than unrelated trials. However, the pattern of interference changes with increasing proficiency in the L2 (e.g., Sunderman & Kroll, 2006).

An exciting new observation in the research on acquisition is that ERP methods have shown that the brain is sensitive to implicit processes in early stages of acquisition that may not be revealed in behavioral performance (e.g., McLaughlin, Osterhout, & Kim, 2004). McLaughlin et al. demonstrated that learners in the earliest phases of foreign language exposure actually know more about the new language than their behavioral performance suggests. Similarly, ERPs reveal sensitivity to the language not in use even when behavioral data suggest that the bilingual's other language is effectively switched off (e.g., Thierry & Wu, 2007).

Comprehension

Bilingual comprehension has been investigated using a variety of offline (grammaticality judgments, accuracy rate, and response RTs) and online (self-paced reading RTs, and eye-tracking) behavioral measures. The general outcome indicates that for sufficiently proficient L2 speakers, L2 processing strategies resemble L1's (this seems not to be the case for special grammatical constructs like grammatical gender processing). However, there are some special signatures of L2 processing. Reading is typically slower in L2 than L1 and the time needed to process critical grammatical constructions (as revealed from RTs) is longer for L2 speakers. The observed disadvantage for processing in L2 may be understood as the requirement to recruit additional working memory resources in the less skilled language (McDonald, 2006). The coupling of offline and online measures has been particularly important to disentangle the factors that influence L2 processing. Of interest are studies that merge experimental paradigms to investigate the role of immersion in an L2 environment. For example, the parsing of ambiguous sentences in two groups of bilingual speakers (L1 Spanish/L2 English and L1 English/L2 Spanish) has been investigated by Dussias (2003) using offline (pencil and paper questionnaires, grammaticality judgments) and online (self-paced reading) tasks. Results converge in showing that Spanish/English bilinguals show different parsing preferences than monolingual Spanish speakers, suggesting that the parsing strategies in L1 may change as a function of the length of immersion in the L2 environment. Similar results using the same type of ambiguous constructions have been reported analyzing eye movements. Eye movements are informative because they provide an online measure of the time course of syntactic processing while participants read or listen to sentences. Dussias and Sagarra (2007) showed that Spanish-English bilinguals with extensive immersion in an English language environment process sentences in Spanish, their native language, using preferences associated with English, their L2.

If behavioral measures provide fundamental information on how language is processed in bilingual speakers, the use of neuroimaging techniques reveals its neurophysiological basis (ERPs) and its functional brain correlates (fMRI). The growing body of neuroimaging evidence suggests that proficiency may play a more central role in modulating L2 processing than age of acquisition (AoA). ERPs have been particularly sensitive to implicit neurophysiological activity related to grammatical processing even in early L2 learners who otherwise perform at chance behaviorally (e.g., Tokowicz & MacWhinney, 2005).

While ERPs provide a sensitive measure of the time course of language processing, fMRI has a relatively high spatial resolution that permits investigations of the cortical representation in bilinguals. One of the topics that has been examined with fMRI is the relative contribution of AoA and proficiency to the patterns of cerebral activation in L1 and L2. Perani et al. (1998) investigated whether bilingual speakers with different proficiency levels and different AoA have similar cortical representations. Results revealed that

proficiency rather than AoA was critical for determining the cortical representation for L2. However, it is also possible that proficiency and AoA affect different linguistic processes (i.e., semantics and syntactic processing). A reading of the recent literature suggests that these factors may play different roles in accounting for fMRI data on syntactic and semantic processes.

Production

Historically, research on production in both monolinguals and bilinguals has lagged behind research on comprehension because of the difficulty associated with controlling the nature of spoken output. Early production research relied primarily on observations of errors that occurred in natural speech (e.g., Garrett, 1993). The development of experimental approaches to reveal the components of error free production (e.g., Levelt, 1989) was a critical step in enabling a body of research that has investigated the processes that underlie the planning of speech in both the L1 and L2. Much of this work has exploited variants of picture naming tasks to examine the factors that come into play over the time course of planning single words, phrases, and sentences.

Perhaps the most widely used paradigm has been the picture-word Stroop task in which a picture is named in the presence of a distractor word that is visually present or spoken. By varying the timing of the presentation of the distractor relative to the picture, it is possible to identify the nature of the information that is active at a given moment in planning a spoken word. In both monolingual and bilingual studies, the general finding is that semantic information interferes early in the process of planning a single word utterance but that phonological information facilitates production when presented later in planning (e.g., Levelt, 1989). At issue theoretically is the sequencing of these processes, a point of debate in both behavioral and neuroscience research on this topic, with some arguing for a discrete, sequential process (e.g., Levelt, 1989) and others for an interactive model in which cascaded processes are initiated in parallel once processing has begun (e.g., Goldrick, 2006).

In bilingual research on spoken production (e.g., Costa, 2005), there is evidence that both languages are active even when bilinguals intend to speak in one language only. Bilinguals are faster to produce the names of pictured objects when the names are cognates in their two languages and their spoken responses are affected by the properties of the language not in use. The question then is how this activity is modulated to allow the selection of the intended language. See the illustrative example in the box below to understand better how experiments on lexical production in bilinguals are designed and analyzed.

Some argue that bilinguals have the ability to ignore the language they do not intend to speak, even if it is momentarily active during speech planning (e.g., Costa, 2005) whereas others (e.g., Green, 1998) argue that there is competition for selection among all activated language alternatives with an eventual requirement to inhibit the unintended language. The empirical approach to this question has relied largely on evidence from the language switching task (e.g., Meuter & Allport, 1999), in which bilinguals produce words in one language or the other as a function of cues that are presented (e.g., a colored background) to signal the language to be spoken. The main finding in this work is that language switching is costly to processing but more costly to the L1 than to the L2. This counterintuitive result has been taken as support for the inhibitory hypothesis; production of the weaker L2 is assumed to require inhibition of the stronger L1 and that inhibition remains present when the bilingual is then later required to produce L1. In the debate surrounding this interpretation, there is now evidence from both ERP and fMRI studies using adaptations of the switching paradigm modified for neurocognitive procedures (e.g., Abutalebi et al., 2008).

An Illustrative Case: A Hypothetical Experiment on Lexical Production in Bilinguals

In this hypothetical experiment, modeled on many actual experiments that have been performed (e.g., Costa, Caramazza, & Sebastian-Galles, 2000; Hoshino & Kroll, 2008), we illustrate how data are collected and analyzed in a psycholinguistic experiment. The goal of the hypothetical experiment is to determine whether bilinguals can turn off the language not in use when speaking words in one language alone. The logic is to ask highly proficient Dutch-English bilinguals to name pictures in English, their L2. Some of the pictures have names in Dutch that are cognate translations (e.g., the name of a banana in Dutch is *banaan*) but others have names in Dutch that are distinct (e.g., the name of a bicycle in Dutch is *fiets*). If bilinguals cannot avoid the activation of their L1 when they speak words in the L2, then we might predict faster naming times for pictures whose names share phonology and other aspects of word form relative to control pictures whose names do not overlap closely in word form. Bilinguals should reveal an advantage in naming cognate pictures but monolingual English speakers should not.

Method

Note that in an actual experiment there would be a larger number of participants and pictures and additional measures would be administered to be sure that there was close matching across the participants groups and across the pictures and their names.

Participants: Five highly proficient Dutch-English bilinguals and five native English-speaking monolingual control participants, otherwise matched in age and education, participated in the hypothetical experiment.

Materials: The experiment included 20 pictures of which 10 had cognate names like *banana* and *banaan* and 10 had noncognate names like *bicycle* and *fiets*.

Procedure: Pictures were presented briefly on a computer screen and participants were asked to name them as quickly as possible by speaking their name aloud into a microphone; response time to begin to articulate the picture's name was recorded and the participant's spoken responses were recorded to code the data later for accuracy. The sequence of pictures with cognate and noncognate names was randomized.

Results

The data were coded and only the correct responses were entered into the statistical analysis. It is typical to clean response time data first to exclude not only errors and omissions but also outliers that fall 2.5 standard deviations above or below an individual's mean response time. If there are a sufficient number of errors, not only the error rate but also the type of error might be analyzed. For present purposes we present the response time data only assuming that it has already been cleaned and coded to exclude errors and outliers.

Analysis

As we can see in the means (Table 1), the bilinguals were faster to name cognate than control pictures. The monolinguals took about the same amount of time to name cognate and control pictures. For the monolinguals, the cognate manipulation has no meaning because they are English speakers who do not know the names of the pictures in Dutch. Although the Dutch-English bilinguals were naming the pictures in English only, they appeared to be influenced by the convergence across English and Dutch when they produce the cognate names of pictures that are similar in the two languages. This is precisely the pattern that has been reported in past studies. Note as well that the monolinguals were

faster than the bilinguals. The monolinguals were naming pictures in their L1 whereas the bilinguals were naming pictures in their L2.

It is always helpful to see what the data look like as well although Figure 1 is redundant with the information in Table 1. In an actual paper, you would include either the table or the figure but not both. Each way of displaying the data provides an alternative visualization of the results.

The next question in analyzing the data is to determine whether these differences were statistically reliable. To do that, we submit the data file to SPSS to perform an analysis of variance (ANOVA) with one repeated measure, cognate status, and with one between-group factor, speaker group. Cognate status is a repeated measure because all of the participants named both cognate and control pictures. Speaker group is a between-group factor because an individual can only be either a bilingual or a monolingual but not both.

Table 1 Mean response times for monolinguals and bilinguals

<i>Group</i>	<i>Participant</i>	<i>Cognate*</i>	<i>Control</i>
Bilinguals	1	1,021	1,089
	2	1,219	1,360
	3	907	975
	4	745	832
	5	1,000	1,084
<i>Mean bilingual:</i>		978	1,068
Monolinguals	1	693	707
	2	747	777
	3	1,066	1,052
	4	807	784
	5	734	739
<i>Mean monolingual:</i>		809	812

*All data are mean response times to name pictures in milliseconds.

Descriptive Statistics				
Group		Mean	Std. Deviation	N
Cognate	Bilingual	978.40	173.020	5
	Monolingual	809.40	149.145	5
	Total	893.90	176.422	10
Control	Bilingual	1068.00	193.847	5
	Monolingual	811.80	137.807	5
	Total	939.90	208.264	10

Figure 4 SPSS display of means

In SPSS you go to the *analyze* menu, then choose *general linear model*, and then choose repeated measures. You will then need to name and identify your two variables as shown below:

If you then click on the *options* key, you can indicate that you want the output to include means for all of the main effects and interactions:

You then click on *continue* and *OK* and run the analysis. The output will include a series of tables that will give you the means for each condition and collapsed across conditions and also the ANOVA table of statistical results. Note that the variable CogStatCogCon is coded that way to indicate that the data for the cognate condition were entered first followed by the data for the control condition.

Figure 4 shows what a table of means will look like in SPSS. Note that in a reaction time experiment such as this one, we can only measure to the nearest millisecond so you can round off these values.

There will be two separate ANOVA tables that are critical, one for the within-subject factors (in this case we have only one—cognate status) and the other for the between-subject factors (and here we also have only one—speaker group).

The two tables in Figures 5 and 6 give you the F values for the two variables and their interaction. The analysis that we just performed is a subject analysis or an F1 analysis. In

Figure 6 SPSS ANOVA table of statistical results between subjects

many psycholinguistic studies, we perform both subject and item ANOVAS. The item ANOVA generates F2 values (also see the special issue of *Journal of Memory and Language*, 2008, on “Emerging Data Analysis” for a recent discussion of statistical issues related to these types of psycholinguistic data).

If you were writing about these results in an actual paper, you would note that there was a main effect of cognate status, $F(1, 8) = 31.17, p = 0.001$, a marginal effect of speaker group, $F(1, 8) = 4.18, p = 0.075$, and a significant interaction between cognate status and speaker group, $F(1, 8) = 28.00, p = 0.001$. Depending on the journal, you might also include a measure of variability such as the mean square error when you report each of the F values.

These hypothetical results show that bilinguals were somewhat slower to name pictures in their L2 than monolinguals were in their L1 but that only bilinguals produced a cognate advantage, supporting the claim that bilinguals activate the language not in use when planning speech in one language alone.

Summary

We have illustrated some of the methods that are representative of current experimental research on bilingualism and the theoretical controversies to which they have been applied. What should be clear from what we have summarized is that there is a great deal of excitement around the joint use of behavioral and neurocognitive methods that reveal aspects of language processing in bilinguals that would not otherwise be evident by using one method alone. This is an enterprise that is rich in its potential not only to elucidate aspects of bilingualism but also for the purpose of using bilingualism as a tool to understand the constraints and plasticity associated with the language system more generally.

Bilingualism and Speech Perception

NURIA SEBASTIAN-GALLES, BEGOÑA DÍAZ, AND ALBERT COSTA

Introduction

Speech perception refers to the process whereby acoustic linguistic information is interpreted and given a meaning. It proceeds through a series of stages in which acoustic cues are extracted and stored in sensory memory and then mapped onto linguistic information. Crucially, the relevance of these acoustic cues varies across languages in a very important way (Mattys, White, & Melhorn, 2005), and certain acoustic cues may have a linguistic significance for a particular language, but not for another. These crosslinguistic differences lead to significant differences in the way native and non-native listeners process subphoneme traits (Underbakke, Polka, Gottfried, & Strange, 1988), syllables (Cutler, Mehler, Norris, & Segui, 1986), stress patterns (Dupoux, Peperkamp, & Sebastian-Galles, 2010), and phonotactic constraints (Sebastian-Galles & Bosch, 2002). This research also suggests that learning a second language can imply nonexclusive solutions to bridge the gap between native and non-native speech processing: the suppression of the first language strategy, the development of new and separate strategies for the second language, and a compromise of the reweighting of each cue. The specific solution for each case depends, though not exclusively, on the relative properties of the two languages of the bilingual. For instance, if the sound to be learned has no close correspondence with the learner's existing language, like Zulu clicks for English native listeners, listeners may develop new processing strategies that most likely will not affect how the first language is perceived. On the contrary, if the sounds to be learned are similar though not identical to those of the native language, adjustments of the already existing processes and representations are most likely to be needed; so, for example, Japanese listeners must modify the way they categorize some sounds in their first language in order to perceive the English contrast between /r/ and /l/ (see Best, 1995; Flege, 1995). Similarities and differences between the two languages of a bilingual therefore play a fundamental role in how the speech processing system will cope with the two languages.

We have used the term "bilingual" without giving a formal definition. It is very difficult (if not impossible) to give a general definition of the term. In some studies, a difference is drawn between bilinguals (who are supposed to be highly skilled in both languages) and second language (L2) learners (who are supposed to be less skilled in their L2). In reality, both terms can refer to the same populations. Rather than defining what a bilingual is (or is not), we prefer to use the dimensions early/late and proficient/non-proficient to properly characterize a particular group of individuals.

Given this preamble, a basic question in bilingual speech perception is whether bilinguals can master (or not) the phonological properties of their two languages. Another basic question is the extent to which bilinguals can switch off the language not being used during speech perception. In this entry we will provide a brief overview of the research devoted to these basic questions.

Perception of Segments/Phonology

The perception of foreign sounds (either isolated or integrated in different suprasegmental units) is one of the most difficult aspects to master when learning a second language. The origin of such difficulties could be related to the perceptual reorganization accomplished during early development. As will be described below, babies' perceptual system becomes attuned to the phonetic inventory of the maternal language during the first year(s) of life. Parallel to this attuning is what has been described as a perceptual "loss": Infants become worse at perceiving phonemic contrasts that are non-existent in the maternal language as they gain experience with the language(s) in their environment. Despite this relative loss in the ability to perceive foreign sounds, the perceptual system is still able to perceive the acoustically relevant information of non-native speech sounds, as different electrophysiological studies have shown (Tremblay, Shahin, Picton, & Ross, 2009). Therefore, with the appropriate input it should be possible to attain native-like speech perception performance for non-native sounds. Results from training studies strongly support this idea in that the changes induced by exposure to new phonemes occur even after relatively short exposures (Tremblay, Kraus, Carrell, & McGee, 1997; Tremblay et al., 2009). These results account for the fact that even late bilinguals can improve their non-native speech perception abilities, and suggest that the amount and quality of the second language input is fundamental in determining final performance levels (see, for instance, Flege, 2003).

However, different conclusions are usually reached when highly skilled bilinguals who have learned both languages in naturalistic environments are compared in the perception of their first and second languages. These studies show that in general, even for simultaneous bilinguals, there is some processing advantage for the first language when compared with the second one; this is the case for the perception of phonemes (Pallier, Bosch, & Sebastian-Galles, 1997; Sebastian-Galles, Echeverria, & Bosch, 2005), lexical stress (Dupoux et al., 2010), or speech segmentation (Cutler, Mehler, Norris, & Segui, 1989). Additional research with early and highly proficient bilinguals has shown that even those individuals that reach native-level speech perception performance may rely on acoustic parameters that are different from those of native listeners, at least for difficult foreign speech sounds. For instance, Underbakke et al. (1988) observed that Japanese listeners use temporal differences to distinguish the English-specific [ɪ]–[I] contrast, while native American English listeners use the spectral differences between the second and third formant frequencies as primary cues. These results show that the perception of foreign speech sounds, when compared with native speech perception, is sustained by different (and sometimes less efficient) procedures.

The conclusions of the studies addressing the question of how phonology is acquired by bilinguals paint a mixed picture. According to defendants of the idea that there are no limits to the learning of a second language (provided the adequate input), significant learning occurs even in the case of adult individuals and short training regimes. However, defendants of the idea that there are qualitative differences between the learning of the first language and learning of the second substantiate their conclusions through the fact that bilinguals exposed to an optimal environment (as balanced as possible) show a clear advantage in the perception of one of their two "first languages." While both hypotheses must be correct (as there is substantial evidence supporting both of them), a clear theoretical account accommodating all the evidence is still lacking.

Figure 1 Example of a visual display presented to participants in Spivey and Marian's (1999) study testing Russian–English participants

Note. Two experimental conditions are shown: one with an interlingual distractor (“marker,” upper left) or a baseline (“ruler,” upper left). Participants look at interlingual distractors more often (52%) than at baselines (37%) when asked to act on the targets (e.g., “Put the stamp below the cross”), showing a parallel activation of the participants’ two languages (e.g., “stamp” is *marku* in Russian).

Word Recognition: Access and Representation of the Bilingual Lexicon

Counterintuitive as it may be, a large body of research supports the idea that lexical access in bilinguals proceeds in a language-nonselective manner, in the sense that during word recognition the two lexicons of a bilingual are activated in parallel. According to this account, lexical representations from both languages always get activated to a certain degree, even if only one language is task-relevant. This has been shown for both visual and auditory word recognition, but also for word production.

One of the experimental paradigms widely used is the visual world paradigm (see Figure 1). In this setting participants are looking at a grid-like display containing a central fixation point and four objects placed at the corners of a square.

Participants are asked to move a named object to another location in the square (or to click on it or just to look at it). Participants’ eye movements (or hand/mouse movements) are recorded. Spivey and Marian (1999) were the first to use this paradigm to explore nonselective activation of lexical items. These authors tracked the eye movements of Russian–English bilinguals as they were asked to move different objects. Crucially, the critical target object (e.g., a stamp, which is *marku* in Russian) started in the same way as the English name of another object in the array (e.g., the word “marker”). The remaining objects in the array had names with no phonological similarity to the target word in either language. The results showed that bilinguals were more likely to look at the distractor object whose name in the other language sounded like the target (in the example a marker), relative to control objects. Given that nothing in the experiment could be claimed to induce the activation

of the non-target language, these results are taken as evidence of a parallel activation of the two lexicons of a bilingual. Furthermore, stronger effects have been found when the non-native language is explored; in other words, bilinguals suffer from more lexical interference when accessing the non-native lexicon than when accessing the native one.

Despite these evidences, bilinguals can sometimes exploit subphonemic cues to constrain lexical activation to a certain extent. Using the visual word paradigm, Ju and Luce (2004) showed that, although lexical activation is nonselective, bilinguals can make use of subphonemic cues (such as voice onset time) to constrain lexical activation. Nevertheless, when the (sub)phonemic cue is difficult to perceive (as occurs with difficult non-native contrasts), bilingual lexical access is less effective and bilinguals may treat as homophones words that would be minimal pairs (i.e., word pairs that share all phonemes but one) for natives. For instance, Pallier, Colome, and Sebastian-Galles (2001) obtained equivalent repetition priming effects in a lexical decision task for minimal pairs containing a difficult vowel contrast and for real repetitions.

The results of bilingual lexical activation studies show that the same kinds of mechanisms of lexical access of parallel activation and subsequent reduction as a function of mismatching information, previously described for monolingual participants, apply in the case of bilinguals.

Individual Differences in Second Language Perception

Bilinguals differ in their ability to perceive the sounds of their second language. The main factor behind individual differences in second language perception is the age at which the second language is learned, revealing that the earlier a language is learned the better it is perceived (Flege & MacKay, 2004). This age constraint has led to one of the central debates in psycholinguistics: the debate around the existence of a critical period for second language learning in terms of brain maturation. Still, bilinguals who acquired their second language at the same age differ greatly in their mastery of second language phonetic contrast, as assessed by means behavioral tasks.

Several training studies have explored the brain anatomical and functional differences between successful and less successful non-native speech contrast learners. At the anatomical level, Golestani, Molko, Dehaene, LeBihan, and Pallier (2007) have shown that the rate of learning to discriminate an unknown phonetic contrast (e.g., the Hindi dental-retroflex contrast) in a laboratory training context positively correlates with (a) the white matter density of left Heschl's gyrus (the neural substrate of the primary auditory cortex) and (b) leftward asymmetry in white matter volumes in the parietal lobes. The authors suggested that the larger white matter volume present in the fast learners' left auditory cortex may reflect a more efficient processing of rapid temporal sounds.

In a functional magnetic resonance imaging (fMRI) study, Golestani and Zatorre (2004) studied whether differences in the learning of a new phonetic contrast (the Hindi contrast previously mentioned) also led to distinct activation patterns. Indeed, while performing a discrimination task on the trained non-native contrasts—compared with listening to white noise—successful and less successful learners exhibited distinct brain activation patterns. Successful learners showed a deactivation of the left middle temporal gyrus while less successful learners exhibited a suppression of the activity of the left angular gyrus and an increase of the activity in insula-frontal opercular regions. These results were interpreted as a reflection of greater neural efficiency of frontal areas in successful learners. These training studies provide relevant data about the neural mechanisms that allow individuals to quickly learn a new speech contrast, but they do not tap into the final acquisition of a second language phonetic contrast.

Figure 2 Mismatch negativities (MMNs) obtained for “good” and “poor” perceivers of an L2 phonetic contrast in response to a native and a non-native (unknown) phoneme (adapted from Diaz et al., 2008)

Note. “Good” perceivers displayed larger MMN responses than “poor” perceivers for the two different phonemes. Grey boxes indicate statistical differences between the two groups of bilinguals for the early subcomponent of the MMN (light grey) and the late subcomponent (dark grey).

To the best of our knowledge, only one study has compared the brain correlates of bilinguals who master the second language phonetic system to different degrees. Diaz, Baus, Escera, Costa, and Sebastian-Galles (2008) compared the event-related brain potentials (ERPs) of two groups of early proficient bilinguals who master a second language speech contrast to different extents. The two groups were compared in their brain responses to acoustic (involving tones of different duration, frequency, and presentation order) and speech (involving a native, /o/–/e/, and an unknown, /o/–/ö/, phonetic contrast) changes detection. Participants’ discrimination accuracy, reflected electrically as a mismatch negativity (MMN), was similar between the two groups during the perception of tone changes. However, the neural response to the perception of speech sounds differed between the groups, and was reduced for the group with poorer performance on the second language behavioral tasks (see Figure 2).

Crucially, this reduction of the brain response to speech sounds was not only observed for the non-native phonetic contrast, but also for the native one. This difference in native perception reveals that individual differences in second language perception do not only stem from age constraints or other possible factors (such as motivational factors) since these factors do not vary in the acquisition of the native language. It remains to be seen whether these individual differences in second language perception correlate with differences in verbal abilities or other cognitive abilities which have not received much attention in the field of second language perception.

The Bilingual Infant/the Bilingual Child

Although the literature on bilingual language acquisition is quite extensive, issues such as the following have only recently been addressed: When do bilingual infants notice the existence of two “sound systems”? How do they organize the sounds of their two languages? And how do they recognize their first words?

Given that, at birth, newborns can discriminate between some, but not all, languages based on their rhythmic pattern, children born in bilingual environments can face two different situations: The two languages either can (e.g., English–Tagalo) or cannot (e.g.,

Catalan–Spanish) be initially differentiated. Although the results have shown that the way in which bilingual-to-be infants differentiate their languages of exposure may not be fully identical to that followed by infants growing up in monolingual environments, bilingual exposure does not generate specific problems in the processes of language differentiation, even in the case of perceptually challenging situations where initial discrimination at birth is not present.

Research with monolingual infants has shown that starting around 6 months of age, infants specialize in the phonetic repertoire of their maternal language, diminishing their capacity to discriminate between foreign phonetic contrasts and enhancing the discrimination of the native ones (this is called “perceptual reorganization” or “perceptual loss”). How does this perceptual reorganization work when infants are exposed to two languages? A few studies have addressed the perceptual reorganization in bilingual infants, in the context of vocalic and consonant contrasts in Catalan–Spanish (both vowel and consonant contrasts) and French–English (consonant contrasts), yielding mixed results. In a series of studies using a familiarization procedure it has been observed that Catalan–Spanish bilingual infants show a U-shaped discrimination pattern between the ages of 6 and 12 months (with an apparent lack of discrimination around the age of 8 months). However, French–English bilinguals show equivalent behaviors to their monolingual peers. A different procedure has more recently shown Catalan–Spanish bilingual infants as having equivalent discrimination patterns to their monolingual peers. The different results observed in the various populations tested (and with the different procedures used) could be revealing differences in the language processing strategies induced by the specific language pairs learned by the different populations (and by the task-specific cognitive demands).

Another domain that has been recently explored using experimental methods is the representational format of early acquired words. Some studies suggest that the early lexical representations of bilinguals may possess less fine-grained phonological detail than those of monolinguals (Ramon-Casas, Swingley, Sebastian-Galles, & Bosch, 2009). However, more recent data suggest that the apparently less successful developmental trajectory of bilingual infants may be due to some specific testing conditions and that, in fact, bilingual infants may even outperform monolingual infants (Mattock, Polka, Rvachew, & Krehm, 2010).

Taken together, the results of the studies addressing the early development of infants exposed to bilingual environments show both similarities and differences regarding the development of monolingual infants. Some of the observed differences may originate in the additional processing demands that some testing situations impose on bilingual infants. Indeed, it is usually the case that materials and testing situations are built in such a way that they are “linguistically neutral”: The same materials are used for the different types of monolingual and bilingual populations. Thus, contrary to monolinguals, bilingual infants may need to determine which of their two languages they are listening to. As mentioned above, bilingual infants can even outperform monolinguals when these factors are properly considered. Additionally, Albareda-Castellot, Pons, and Sebastian-Galles (in press) and Sebastian-Galles and Bosch (2009) have proposed that differences in the nature of the input (such as the differences in language overlap across language pairs, e.g., comparing two Romance languages, such as Spanish and Catalan, vs. comparing typologically different languages, such as French and English) can also affect the specific mechanisms that bilingual-to-be infants develop to cope with their input.

Finally, differences between monolingual and bilingual exposure have also been reported in the use of basic heuristics of word meaning, such as mutual exclusivity (Byers-Heinlein & Werker, 2009), in the capacity to extract regularities in speech streams (rule-like; Kovács & Mehler, 2009b), and in the early development of executive functions (Kovács & Mehler, 2009a; Kovács & Mehler, 2009b).

Future Directions

In recent years our knowledge of the underlying mechanisms involved in bilingual speech perception has grown exponentially. Cross-language and bilingual research has shown a complex interaction between native and non-native language processing units. Studies have shown important commonalities between the underlying mechanisms of speech perception in monolingual and bilingual listeners, but also specific adaptations to bilingual input.

New questions are likely to be added to already existing ones; a couple only are mentioned here. In recent years, the influence of visual information in speech perception has been attested. In the case of audiovisual input, perception is the blending of visual and auditory information (as shown by the McGurk effect). It is clear that (less skilled) bilinguals greatly benefit from “seeing” non-native speech. Some pioneering studies are showing the relevance of this information in developmental (Weikum et al., 2007) as well as proficient cross-language and bilingual speech perception (Navarra, Sebastian-Galles, & Soto-Faraco, 2005; Soto-Faraco et al., 2007).

Another field with a lot of potential development lies on the too often neglected relationship between perception and production of non-native speech (or between the two languages of a bilingual). Only a few studies have explored in a systematic way the two sides of bilingual speech processing (Flege, 2003).
